

AN ACCOUNT OF THE SOUTH AFRICAN MATERIAL OF *ARISTIDA* LINN. IN CERTAIN EUROPEAN AND SOUTH AFRICAN HERBARIA.

By

H. G. Schweickerdt.

Scope of the Present Paper.

Until the time of publication of Henrard's classical Revision and Monograph of the genus *Aristida* L., great difficulty was experienced in naming critically any South African material of this genus. As Henrard was in a position to examine only a limited number of South African specimens owing to the great amount of time which the examination of such a large genus necessarily involved, the author of the present paper undertook to align and name up critically all the material in the South African Herbaria. He, furthermore, extended his original intention and later on included the South African material deposited in most of the Herbaria enumerated below. In the course of these investigations several difficulties were encountered. Several doubtful points however have also been settled. Where necessary and desirable the specific descriptions as given by Henrard have been modified to include the very wide range of material (about 6,000 sheets) studied. The sequence of the enumerated species is not strictly according to the plan as adopted by Henrard; his work, however, has formed a basis which the present author has merely attempted to enlarge upon.

Acknowledgments.

My sincere thanks are due to the Directors of the various Herbaria mentioned below for the many facilities afforded in the carrying out of these investigations. Special thanks are due to Mr. C. E. Hubbard of Kew and Prof. Dr. R. Pilger of Berlin-Dahlem, for their kind assistance and suggestions.

Herbaria Consulted.

The various Herbaria in which the numerous specimens cited are deposited, have been indicated by the bracketed abbreviations following such specimens. These indices refer to the respective Herbaria enumerated below.

- A..... Albany Museum, Grahamstown.
- B..... Botanisches Museum, Berlin-Dahlem.
- BH..... Bolus Herbarium, Cape Town.
- BM..... British Museum (Natural History), London.
- D..... Natal Herbarium, Durban.
- G..... Conservatoire Botanique, Geneve.
- GU..... Grey University College, Bloemfontein.
- K..... Royal Botanic Gardens, Kew.
- L..... Rijksherbarium, Leiden.

LG.....	Herb. Trinius, Leningrad.
Mc.....	McGregor Museum, Kimberley.
N.....	National Herbarium, Pretoria.
O.....	Fielding Herbarium, Oxford.
P.....	Museum National d'Histoire Naturelle, Paris.
S.....	South African Museum, Capetown.
Sreg.....	Regional Herbarium, University, Stellenbosch.
St.....	University of Stellenbosch.
T.....	Transvaal Museum, Pretoria.
U.....	University of Cape Town.
V.....	Naturhistorisches Museum, Wien.
W.....	U.S. National Herbarium, Smiths. Inst., Washington.
WR.....	University of Witwatersrand, Johannesburg.
Z.....	Botanisches Museum, Zürich.

In addition to the above, the following abbreviations are used throughout:—

Hennard Crit. Rev... A Critical Revision of the Genus *Aristida* by J. Th. Hennard in Mededeelingen van 's Rijksherbarium Leiden Nos. 54 (1926), 54A (1927), 54B (1928), 54C (1933).

Hennard Monogr..... A Monograph of the Genus *Aristida* by J. Th. Hennard in Mededeelingen van 's Rijksherbarium Leiden Nos. 58 (1929), 58A (1932), 58B (1933).

The Subdivisions of the Genus.

Hennard's brilliant Revision and Monograph of the genus has shown that the species readily fall into seven sections. The species of any one particular section form with but a few exceptions, a fairly homogeneous group. These sections are based solely on organographic characters of the inflorescence, i.e. the spikelet. So far the existing sections of the genus have proved to be quite adequate.

Theron in Fedde, Rep. 40. I. ff. (1936) has published the results of an anatomical study of the leaves of many South African species of *Aristida*. He has drawn up four anatomical groups and cites the species constituting these groups. His first group consists of species typical of § *Stipagrostis* and § *Schistachne*. The second group consists of species belonging to §§ *Stipagrostis*, *Chaetaria* and *Arthratherum*. The third group is formed by elements belonging to §§ *Stipagrostis*, *Arthratherum*, *Chaetaria* and *Pseudarthratherum*. The fourth group consists of members belonging to the § *Stipagrostis*.

All the anatomical groups except the fourth are thus composed of elements taken from two or more organographic sections and thus if considered from an organographic point of view these groups are extremely heterogeneous in constitution. If the leaf anatomy leads one to place together in one group such diverse elements as *A. geminifolia*, *A. bipartita*, *A. barbicollis* and *A. spectabilis*, all of which are organographically very distinct from each other, a classification based on leaf anatomy is highly artificial and shows no advantages over a natural classification based solely on organographic characters. Theron's fourth anatomical group consisting of *A. lanipes*, *A. gonatostachys*, *A. subacaulis* and *A. Hermanni* is the only one acceptable since its constituents form a fairly homogeneous unit both from an anatomical and organographic point of view. It is interesting to note that the anatomical structure of the leaves in *A. capensis* and *A. sericans* bear very great resemblance to each other. These species organographically likewise show a great deal of convergence. The recently described *A. capensis* Thunb. var. *Dieterleniana* mihi superficially resembles *A. sericans* Hack. so closely that these plants could readily be confused. Theron's argument

that an anatomical key to the **species** (South African) of *Aristida* is of economic importance is justified up to a degree. It is only after one is able to distinguish the various S. African **genera** of Gramineae solely on basis of their vegetative characters that the results of Theron's researches will fully be made use of.

Key to the Sections and the South African Species.

- | | |
|---|-----------------------------|
| 1. Central awn, or central and both lateral awns of the lemma
distinctly plumose..... | 2 |
| Central awn, or central and lateral awns never plumose..... | 3 |
| 2. Body of the lemma with an articulation situated at or just
above its middle ; at maturity the awns and column break
off together with the conical hollow upper part of the
lemma..... | |
| Body of the lemma not articulated at or slightly above its
middle, but moreover the column of the awns is articulated
at its point of insertion near or at the apex of the lemma ;
column together with the awns disarticulating upon
maturity without a part of the lemma..... | |
| Body of the lemma, column and awns show no signs of an
articulation..... | |
| 3. Body of the lemma, column and awns show no signs of an
articulation ; column present or totally wanting ; callus
never bifid..... | |
| An articulation is present, very rarely absent, but if so then
callus always bifid..... | |
| 4. The articulation is situated at the summit of the column just
below the branching point of the awns ; column usually
well developed ; callus never bifid..... | |
| The articulation is situated between the summit of the
lemma and the foot of the column ; if the column is absent
then the callus is distinctly bifid or rounded..... | |
| 5. Callus bifid, emarginate, truncate or long-acute ; column of
awns usually well-developed ; if absent, then the callus
distinctly bifid. The articulation is situated between the
apex of the lemma and the foot of the column..... | |
| Callus rounded ; column is totally wanting, the articulation
is situated between the lemma and the branching-point
of the awns ; margins of the lemma involute..... | |
| I. § Schistachne (Fig. et Denot.) Henr. | |
| 1. Panicle very dense and spikelike ; spikelets nearly sessile ;
position of the glumes usually inverse, the lower usually
distinctly longer than the upper..... | 2 |
| Panicle not dense and spikelike, but loose, or more or less
contracted ; spikelets pedicelled ; position of the glumes
not inverse, the lower shorter or much shorter than the
upper..... | 3 |
| 2. Lower glume long hairy..... | <i>Hochstetteriana</i> (1). |
| Lower glume never hairy..... | <i>secalina</i> (2). |
| II. § Stipagrostis. | |
| III. § Chaetaria. | |
| IV. § Pseudarthratherum. | |
| V. § Arthratherum. | |
| VI. § Pseudochaetaria. | |

3. All the awns of the lemma plumose, usually equally strongly so, or the lateral awns not as densely plumose as the central awn.....	4
Only the central awn of the lemma plumose and densely feathery upwards, the lateral awns never plumose.....	7
4. Internodes woolly or pubescent just below the nodes; panicle-branches woolly-pubescent.....	proxima (3).
Internodes glabrous or scaberulous but never woolly-pubescent; panicle-branches scabrous or glabrous.....	5
5. Suffrutescent and rigid perennial; innovations and branches fascicled; culms 4-5-noded; nodes perfectly glabrous..	namaquensis (4).
Caespitose perennial; culms never branched; nodes conspicuously bearded with a ring of spreading white hairs..	6
6. Glumes acutish, 14-16 mm. long, plumose awns obtuse in outline.....	Schlechteri (5).
Glumes obtuse, about 10 mm. long, plumose awns acute in outline with naked exserted tips.....	hybrida naturalis (6).
7. Glumes of a very firm texture, cartilaginous, glabrous or rigidly ciliate, subequal, linear-oblong, obtuse, with emarginate and slightly ciliolate tips.....	8
Glumes thin, hyaline or papery in texture, glabrous or softly hairy, unequal, lanceolate, acuminate.....	13
8. Nodes conspicuously bearded with a ring of spreading white hairs.....	9
Nodes perfectly glabrous and smooth.....	12
9. Leaf-sheaths and leaf-blades of culm and innovations densely lanate or villous.....	ciliata Desf. var. <i>villosa</i> (7a).
Leaf-sheaths and leaf-blades of culm and innovations never woolly or villous, sometimes slightly hairy on the margin	10
10. Glumes glabrous, not ciliate with spreading hyaline hairs..	ciliata Desf. var. <i>capensis</i> (7).
Glumes or at least the upper glume ciliate with spreading hyaline hairs.....	11
11. Both glumes ciliate with spreading hyaline hairs.....	ciliata Desf. var. <i>pectinata</i> (7b).
Only the upper glume with spreading hyaline hairs.....	ciliata Desf. var. <i>tricholaena</i> (7c).
12. Glumes 8·5-12·5 mm. long, usually glabrous, rarely both rigidly ciliate.....	Schaeferi (8).
Glumes 8-9 mm. long, only the upper ciliate with rigid long hyaline hairs.....	Schaeferi Mez var. <i>biseriata</i> (8a).
13. Panicle erect, linear, very narrow and contracted, but somewhat interrupted near the base; glumes 12-16 mm. long	Dinteri (9).
Panicle open, rather loose; glumes 6-8 mm. long.....	14

14. Glumes covered with soft spreading hairs..... *prodigiosa* (10).
 Glumes quite glabrous..... *prodigiosa* Welw. var.
calva (10a).
- II. § Stipagrostis (Nees) Trin. et Rupr.**
- | | |
|--|--|
| 1. All the awns plumose with long spreading hairs, or the lateral awns at times very scantily plumose (almost naked) | 2 |
| Only the central awn plumose with long spreading hairs, the lateral awns quite naked or very rarely scantily adpressedly ciliate-pubescent | 11 |
| 2. Column of awns well developed (1·5–12 mm. long) and more or less twisted | 3 |
| Column of awns wanting, or sometimes only very short or minute, not twisted into a beak | 8 |
| 3. Nodes glabrous; tip of the central awn always very acute in outline | 4 |
| Nodes distinctly bearded with a ring of hyaline spreading white hairs; central awn plumose to the very tip, obtuse in outline | <i>Schlechteri</i> (5). |
| 4. Column of awns quite glabrous..... | 5 |
| Column of awns distinctly hairy..... | 6 |
| 5. Column of awns much exceeding the glumes; feathers of awns usually bright yellow..... | <i>capensis</i> Thunb. var.
<i>macropus</i> (11b). |
| Column of awns shorter than or slightly exceeding (by 1–2 mm.) the glumes, feathers of awns white or canescent | <i>capensis</i> Thunb. var.
<i>genuina</i> (11a). |
| 6. Glumes glabrous..... | 7 |
| Glumes distinctly softly hairy..... | <i>capensis</i> Thunb. var.
<i>Dieterleniana</i> (11c). |
| 7. Panicle usually overtopped by the leaves; glumes subequal; column of awns up to 4 mm. long..... | <i>capensis</i> Thunb. var.
<i>barbata</i> (11d). |
| Panicle not overtopped by the leaves; glumes slightly unequal; column of awns 6–12 mm. long..... | <i>capensis</i> Thunb. var.
<i>canescens</i> (11e). |
| 8. Lower glume exceeding the upper in length; axils of the panicle-branches glabrous..... | <i>damarensis</i> (12). |
| Lower glume shorter than the upper; axils of the panicle-branches glabrous or bearded..... | 9 |
| 9. Panicle dense and spike-like; axils of the panicle-branches glabrous; the branching-point of the awn produced into two thin, hairy appendages; awns about equal, up to 10 mm. long, equally strongly plumose..... | <i>sabulicola</i> (13). |
| Panicle effuse, pyramidal; the branching-point of the awns not produced into appendages; awns unequal, the central awn densely plumose, the lateral awns almost naked (at most very scantily plumose)..... | 10 |

10. Axils of the panicle-branches distinctly bearded ; central awn obtuse in outline..... *Marlothii* (14).
- Axils of the panicle-branches quite glabrous ; central awn subacute in outline..... *lutescens* (15).
11. Dwarf annuals, not exceeding 10 cm. in height ; inflorescences much congested and almost spike-like..... 12
Perennial species, or if annual then taller than 10 cm..... 13
12. Plants compactly caespitose with the inflorescences almost hidden among the leaf-blades ; branching-point of the awns not conspicuously hairy..... *subacaulis* (16).
- Plants more diffuse with the culms geniculately ascending ; lower nodes usually well-exserted ; branching-point of the awns conspicuously hairy..... *Hermannii* (17).
13. Glumes hirsute or pilose over their whole surface, sometimes glabrous only at the tips..... 14
Glumes glabrous and smooth over their whole surface, rarely with a few marginal hairs, or scaberulous on their whole surface..... 18
14. Column of the awns glabrous below their branching-point or without a pencil of hairs at their branching-point ; central awn obtuse in outline, plumose to the very tip ; panicles short, spike-like, congested, often sheathed by the uppermost leaf..... 15
Column of the awns hairy below their branching-point, or with a pencil of hairs at their branching-point ; central awn with a naked exserted tip ; glumes shortly hairy or pubescent..... 16
15. Culms with very unequal internodes, short near the base, longer upwards and short again towards the top ; leaf-blades of culm-sheaths not well-developed..... *geminifolia* (18).
Culms with very nearly equal internodes ; leaf-blades of culm-sheaths well-developed..... *fastigiata* (19).
16. Annual plants ; lower glume up to 6 mm. long, the upper up to 10 mm. long..... *hirtigluma* (20).
Erect perennial plants ; lower glume \pm 10 mm. long, the upper \pm 13 mm. long..... 17
17. Central awn equally plumose from the base to very near the tip..... *gracilior* (21).
Central awn naked below, with a pencil of hairs at the branching-point of the awns..... *gracilior* Pilger var. *intermedia* (21a).
Central awn naked in the lower part, not bearded at the branching-point of the awns..... *gracilior* Pilger var. *Pearsonii* (21b).
18. Lower glume exceeding the upper in length ; lower glume with many longitudinal rows of minute scabrous hairs on the outer surface..... *obtusa* (22).
Lower glume shorter than the upper ; lower glume not conspicuously minutely scaberulous..... 19

19. Vegetative parts covered with tubercular prominent glands ; suffrutescent rigid perennial..... *brevifolia* (23).
- Vegetative parts devoid of tubercular glands ; suffrutescent or caespitose perennials, rarely annuals..... 20
20. Column with a pencil of hairs at the branching-point of the awns..... 21
- Column without a pencil of hairs at the branching-point of the awns..... 23
21. Central awn naked at least in its lower third..... 22
- Central awn plumose to the base..... *uniplumis* (24).
22. Glumes about 14 mm. long ; central awn somewhat rigid and bristle-like..... *uniplumis* Licht. var. *Neesii* (24a).
- Glumes 8-10 mm. long ; central awn not as above..... *uniplumis* Licht. var. *Pearsonii* (24b).
23. Sheaths of the innovations densely white woolly or at least the margins villous ; dwarf caespitose plants..... 24
- Sheaths of the innovations never densely white-woolly ; plants usually from a suffrutescent much-branched base..... 25
24. Leaves long-hairy between the longitudinal ridges. Axis of inflorescence scaberulous. Nodes and apices of pedicels hairy..... *gonatostachys* (25).
- Leaves glabrous. Axis of inflorescence glabrous. Nodes and apices of pedicels not long-hairy..... *lanipes* (26).
25. Axils of panicle-branches with conspicuous pencils of hairs..... *Marlothii* (14).
- Axils of panicle-branches glabrous..... 26
26. Central awn plumose, acute in outline ; glumes glabrous, unequal..... 27
- Central awn plumose, obtuse in outline ; glumes subequal, usually purple, the lower in the young state dorsally often somewhat shortly hairy, scaberulous on the keel upwards..... *Dregeana* (27).
27. Column 8-10 mm. long..... *garubensis* (28).
- Column 2-5 mm. long..... *lutescens* (15).

III. § Chaetaria (Beauv.) Trin.

1. Awns and column of the lemma densely plumose and hairy as in § Stipagrostis..... 2
- Awns and column of the lemma never plumose or hairy, at most scabrid or glabrous only..... 3
2. Glumes densely villous ; nodes perfectly glabrous..... *sericans* (29).
- Glumes quite glabrous ; nodes with a ring of long spreading white hairs..... *hybrida naturalis* (6).
3. Internodes covered with a fugacious adpressed wool below the nodes, or lanate-woolly all over, sometimes the lower internodes only woolly or pubescent-lanate and the upper glabrous..... *Sciurus* (30).
- Internodes glabrous or seabrous, rarely with some short hairs below the nodes..... 4

4. Panicles dense and spike-like or laxly contracted and more or less interrupted..... 8
- Panicles effuse and open, with the branches remote and divariccate..... 5
5. Position of the glumes inverse, the lower glume exceeding the upper in length..... 6
- Position of the glumes not inverse, but subequal or the lower much shorter than the upper..... 7
6. Annual plants, often somewhat delicate..... 7
- Perennial plants, usually somewhat robust; the lemma shorter than or as long as the glumes; the tips of the glumes reaching up to or surpassing the branching-point of the awns..... 8
7. Glumes very acute, prominently awned, exceeding the lemmas..... 9
- Glumes acute or obtuse, not awned, or the upper glume at most bifid with a mucro from the sinus; lemmas as long as or longer than the glumes..... 10
8. Column well-developed, very variable in length, distinctly twisted..... 12
- Column wanting or lemma produced into a short scarcely-twisted beak..... 11
9. Lower glume exceeding the upper in length, position of glumes "inverse"..... 10
- Lower glume always shorter than the upper..... 11
10. Glumes unequal, the lower about $\frac{1}{2}$ to $\frac{2}{3}$ as long as the upper; internodes distinctly compressed..... 12
- Glumes about equal or slightly unequal, the upper only 1–1.5 mm. longer than the lower; internodes not compressed..... 13
11. Spikelets small; glumes shorter than 10 mm.; lateral awns almost absent or at least much more weakly developed than the central awn; culms usually much-branched from the nodes..... 14
- Spikelets larger; glumes about 10 mm. long or longer, the lower frequently slightly recurved from the apex and either smooth, scaberulous to minutely hairy especially towards the tip; culms rarely branched from the nodes..... 15
12. Lower glume exceeding the upper in length..... 13
- Lower glume always shorter than the upper..... 14
13. Lemmas with longitudinal rows of spiny hairs..... 15
- Lemmas smooth, the midrib scabrous only..... 16
14. Panicles very dense and spike-like, obovate in outline, up to 6 cm. long; body of lemma very scabrous with longitudinal rows of spiny hairs and furrowed ventrally..... 17
- Panicles not densely spike-like; body of lemma not very scabrous and not furrowed ventrally..... 18
- bipartita* (31).
canescens (34).
scabrivialis (32).
effusa (33).
monticola (35).
junciformis (36).
transvaalensis (37).
aequiglumis (38).
rhiniochloa (39).
andoniensis (40).
Hubbardiana (41).

15. Perennial plants.....	16
Annual plants.....	19
16. Glumes very unequal, the lower about half the length of the upper ; spikelets usually small and dark purple.....	
Glumes equal or unequal, the lower more than two-thirds as long as the upper.....	recta (42).
17. Culms markedly compressed below the nodes especially towards the base.....	17
Culms terete.....	junciformis (36).
18. Culms 1-noded ; blades very narrow, setaceous ; panicles short, about 2-2.5 cm. long, lax.....	18
Culms more-noded ; blades flat ; panicles not short, usually long or very long.....	Galpinii (43).
19. Glumes very obtuse and rather broad, both erosebifid and with a mucro from the sinus.....	canescens (34).
Glumes acute or subacute and minutely awned, at least the lower, the upper commonly obtuse and bifid, with a mucro from the sinus.....	curvata (44).
20. Awns of the lemma triquetrous above, very flat over a long distance, with a pronounced midnerve and hyaline rather broadly winged margins ; panicle erect and rather compact and spike-like, now and again somewhat interrupted...	20
Awns of the lemma terete or mostly subtriquetrous, sometimes slightly winged only at the very base, without broad hyaline margins ; panicle somewhat lax at times even flexuous, not very dense and spikelike.....	submucronata (45).
	adscensionis L. subsp. guineensis (46).

IV. § Pseudarthratherum Chiov.

1. Panicles lax and open or composed of more or less peduncled false spikes, sometimes loosely contracted, the long branches erect and appressed, but always naked below and never dense and spike-like.....	
Panicles densely contracted, spike-like, the branches very short, spikelet-bearing from the base, sometimes interrupted or with 1-2 peduncled additional false spikes at the base, rarely not dense and spike-like, but narrowly linear and more or less interrupted, with flexuous subsecund branches nearly always spikelet-bearing from the base.....	barbicollis (47).
2. Lemma granular, densely tubercled in its upper part, quite smooth only in its lower quarter-part.....	2
Lemma smooth, or scabrous only under a strong lens, never densely tubercled.....	alopecuroides (48).
3. Panicles contracted and much-branched, the branches erect or slightly spreading, never spike-like, glumes not very unequal, panicle up to 20 cm. long.....	3
Panicles spike-like, densely contracted, if branched or interrupted at the base, then branches usually spreading, glumes unequal.....	Pilgeri (49).
	4

4. Rigid perennials, inflorescence up to 20 cm. long..... *longicauda* (50).
 Annual or perennial, inflorescence rarely up to 15 cm. long,
 the whole plant usually not exceeding 60 cm. in height.. *congesta* (51).

V. § *Arthratherum* (Beauv.) Reichb.

1. Callus bifid or more rarely almost truncate, rounded or slightly emarginate.....	2	
Callus conical, long acute, never bifid.....	10	
2. Glumes equal or nearly so.....		<i>spectabilis</i> (52)
Glumes very unequal.....	3	
3. Foot of awns more than 2 cm. long, usually 2·5-3 cm. long		<i>stipoides</i> (53).
Foot of awns shorter than 2 cm., usually only about 1 cm. long	4	
4. Ligule a more or less woolly fringe, or a dense line of long soft hairs surrounding the mouth of the sheaths like a flake of wool ; if flake of wool absent then the lowermost internodes densely lanate.....	5	
Ligule a line of very short hairs, no flake of wool present..	6	
5. Lower internodes densely woolly, the upper glabrous ; column of awns rather short, about 6·5 mm. long.....		<i>vestita</i> (54).
Lower and other internodes glabrous ; column of awns usually rather long, up to 15 mm. long.....		<i>meridionalis</i> (55).
6. Culms usually fascicled from a much-branched base and lower nodes.....	7	
Culms never fascicled but usually one- to several-noded..	8	
7. Callus truncate, obliquely truncate, rounded or even slightly emarginate ; lemma dorsally glabrous, very rarely minutely scaberulous.....		<i>dasydesmis</i> (56).
Callus distinctly bifid ; lemma dorsally distinctly scaberulous		<i>Engleri</i> (57).
8. Culms several-noded ; lower glume \pm 6 mm. long, the upper \pm 12 mm. long.....		<i>diffusa</i> Trin. var. <i>Burkei</i> (58a).
Culms 1-2-noded ; lower glume \pm 8-9 mm. long, the upper \pm 15-18 mm. long, if both shorter then the column very short or almost absent.....	9	
9. Column very short or absent.....		<i>diffusa</i> Trin. var. <i>pseudohystrix</i> (58b).
Column well developed \pm 7 mm. long.....		<i>diffusa</i> Trin. var. <i>genuina</i> (58).
10. Internodes densely woolly or lanate-tomentose.....		<i>mollissima</i> (59).
Internodes quite glabrous or minutely scaberulous only, never pubescent.....	11	

11. Inflorescence dense, more or less elongate and spike-like ; column of awns more than 3·5 cm. long..... *stipitata* (60).
 Inflorescence fairly lax, never dense and spike-like ; column of awns about 2 cm. long or somewhat longer..... *graciliflora* (61).

VI. § Pseudochaetaria Henr.

Only South African species..... *hordeacea* (62).

ENUMERATION OF THE SPECIES.

1. **A. Hochstetteriana Beck ex Hack.** in Verh. Bot. Ver. Prov. Brandenb. **30.** 144 (1888) ; Dur. et Schinz, Conspl. **5.** 803 (1894) ; Hack. in Bull. Herb. Boiss. **4.** Append. iii. 18 (1896) ; Stapf in Dyer, Fl. Cap. **7.** 571 (1899) ; Bolus in Ann. S. Afr. Mus. **9.** iv. 234 (1915) pro parte ; Dinter in Fedde, Rep. **15.** 342 (1918) ; Garabedian in Ann. S. Afr. Mus. **16.** ii. 402 (1925) pro parte ; Henrard Crit. Rev. **2.** 234 (1927) ; Henrard Monogr. **1.** 37 cum ic. tab. 1 (1929) ; Range in Fedde, Rep. **33.** 9 (1933).

Perennial, densely caespitose, branched from near the base, forming dense tufts. *Culms* simple, up to about 50 cm. high, erect or somewhat geniculately ascending, 2-4-noded ; internodes terete, substriate, minutely scaberulous or glabrous ; nodes glabrous, often swollen, exserted. Lower leaf-sheaths reduced and scale-like, with very short blades, striate, scaberulous, often more or less woolly at the base ; upper leaf-sheaths tight, striate, scaberulous or with scattered long tubercle-based hairs, shorter than the internodes ; *ligule* a short ciliate rim ; auricles shortly ciliate more rarely long-bearded ; collar smooth ; *blades* convolute or setaceous, those of the innovations up to 14 cm. long, the culm-blades up to 25 cm. long, ending in a setaceous point, glabrous or with scattered long tubercle-based hairs beneath, hirtellous on the upper surface, striate. *Panicle* excluding the awns up to 9 cm. long, usually much shorter, dense, spike-like, up to 1 cm. broad ; axis scaberulous, the lowermost axils of the branches sometimes with a tuft of hairs ; branches solitary, divided nearly from the base ; branchlets very short, scabrous ; pedicels scabrous, about 1-2 mm. long, clavate. *Spikelets* congested, yellowish or greenish. *Glumes* narrowly linear or lanceolate, acuminate, 3-nerved with a stronger midnerve ; the lower glume very scabrous and with long spreading hairs especially dorsally, 13-18 mm. long, *not always exceeding the upper glume in length* ; the upper glume about 12-17 mm. long, glabrous or scaberulous only. *Lemma* spindle-shaped, together with the callus and up to the articulation 5-7 mm. long, below the articulation densely punctulate-scabrous, above the articulation smooth, from the articulation to the branching-point of the awns 8-10 mm. long ; column slightly scaberulous, twisted ; central awn plumose and long-feathery above the middle, the feathery part obtuse in outline, naked in lower quarter, with a naked excurrent tip, 5·5-7·5 cm. long ; lateral awns fine, scaberulous or smooth, 2·2-2·4 cm. long. *Callus* very acute, adpressedly hairy below, long-hairy above, 2·0-2·5 mm. long. *Anthers* 6·0-7·0 mm. long.

SOUTH-WEST AFRICA.

TYPE SPECIMEN.

The type-gathering (*Wyley* s.n.) consists of 7 sheets deposited in the Naturhistorisches Museum, Wien. Beck's manuscript description and dissections are still attached to one of the sheets, and this has consequently been selected by Hennard (Crit. Rev. 235) as the type.

ECONOMIC NOTES.

This species is considered an especially valuable grass. Several collectors state in their field notes that it is much relished by stock.

2. *A. secalina* Hennard Crit. Rev. 3. 552 (1928); Hennard Monogr. 1. 36 cum ic. tab. 1 (1929).

A. Hochstetteriana Beck ex Hack. sec. Garabedian in Ann. S. Afr. Mus. 16. ii. 402 (1925) pro parte, non Beck ex Hack. *Aristida nov. spec.* ex aff. *A. hordeaceae* sec. Hack. in Bull. Herb. Boiss. 4 Append. iii. 20 (1896).

Since this species is very closely related to *A. Hochstetteriana* and may only be distinguished from this in having a glabrous lower glume, it was thought superfluous to draw up a separate description. The description of *A. Hochstetteriana* thus covers the following specimens except for the point of difference mentioned above.

SOUTH WEST AFRICA.

Northern districts (no definite locality indicated), I. 1930, *Drinkuth* 4 (B, K, N, W); Outjo, V. 1933, *Ter Horst* TM. 31844 (T); Spitzkopje, I. 1937, *Boss* TM. 36401 (K, N, T); Karibib, IV. 1913, *Engler* 6163 (B, K); Haikamchab, I. 1907, *Galpin et Pearson* 7435 (K, N, S); Awas mountains, V. 1936, *Boss* TM. 36237 (T); Reise von Walfishbay nach Okahandja, XI. 1885, *Lüderitz* 72 (B, Z); Hereroland, anno 1885/1886, *Lüderitz* 43 (B).

TYPE SPECIMENS.

The two sheets *Lüderitz* 72 et 43 are deposited in the Botanisches Museum, Berlin-Dahlem.

REMARKS.

Hennard (Crit. Rev. 552) states that the specimens on which he based his description are in a very imperfect condition. Owing to the very overmature and damaged condition of *Lüderitz* 72, the present author has found it somewhat difficult to align and identify modern material with this species. After much deliberation and careful examination of the type specimen, he has decided that *A. secalina* Hennard is a close ally of *A. Hochstetteriana* Beck ex Hack. It differs from the latter species by having glabrous glumes. The inverse length of the glumes is not a constant difference, since this character is also met with in *A. Hochstetteriana*.

Hennard's type shows the presence of spikelets in which the column of the lemma is not twisted. This may be explained by the fact that these lemmas are not well-developed. Otherwise they would have disarticulated, since most of the other columns were shed. The more recent gathering *Galpin & Pearson* 7435 also shows the presence of spikelets in which the column of the lemmas is either twisted or not twisted, a character which is thus not reliable. The type specimen has naked central awns. Careful examination has revealed the presence of many "tuberles" in the upper part of these awns. These "tuberles" undoubtedly represent the points of attachment of hairs, and thus the awns at one time or other were plumose. The opinion voiced by Hennard that this species is an "anomalous" [Monogr. Gen. Aristida 1. 24 (1929)] member of the § *Schistachne* can thus no longer receive any support.

3. **A. proxima** Steud. Syn. Pl. Glum. **1.** 145 (1854); Dur. et Schinz, Conspl. **5.** 807 (1894); Stapf in Dyer, Fl. Cap. **7.** 566 (1899); Henrard Crit. Rev. **3.** 468 (1928); Henrard Monogr. **1.** 38 cum ic. tab. 4 (1929); Theron in Fedde, Rep. **40.** 14 (1936).

Elegant, erect or ascending glaucous *perennial*. Culms simple or more rarely branched near the base which appears to be a creeping rhizome, 15–35 cm. high, densely woolly at and just below the nodes, otherwise pubescent, terete or subcompressed, 2–6-noded; internodes usually shortly exserted. Sheaths striate, tight, pubescent with adpressed hairs, the sheath-nodes with a ring or tuft of long white hairs, densely tomentose or woolly; ligules a ciliate rim; auricles densely bearded, the hairs united into a ring at the junction of the blade and the sheath; blades convolute, filiform, rigid and subpungent, glaucous, adpressedly pubescent in lines or becoming glabrous beneath, more or less scabrous-hirtellous on the upper surface, curved, gradually narrowed but not setaceous pointed, up to 10 cm. long, but usually much shorter. Panicle narrow, but rather loose, up to 15 cm. long, but usually shorter, well- or shortly-exserted or sheathed by the uppermost leaf at the base; peduncle pubescent or hairy, angular or subterete; axis of panicle subterete and grooved, somewhat contorted, adpressedly hairy, the axils densely woolly; branches binate, erect, simple or the lower branched above the middle, naked in lower part, up to 5 cm. long, few-flowered, usually only 2–5-spicate, pubescent; pedicels erect or more or less curved, up to 8 mm. long or sometimes as long as the glumes, subclavate, densely woolly towards their tips. Spikelets yellowish and pallid. Glumes unequal, glabrous and smooth, 3-nerved, the lateral nerves shorter than the midnerve and anastomosing with it; the lower 6·5–10 mm. long, the upper 8–11·5 mm. long, both acuminate and mucronate from a slightly bifid apex, both scaberulous only on the keel above. Lemma glabrous, lanceolate-oblong, rounded at the base, abruptly narrowed into the 1·5–2 mm. long callus, body of lemma including the callus 5·25–7·0 mm. long; callus very acute and narrow, long-pointed, densely hairy; articulation of the lemma about 3·5–5 mm. from the base of callus. Awns deciduous with upper part of the lemma, subequal or usually the central awn longer, plumose all along, the lateral from 5·5–9·0 mm. long, the central awn 6·0–11·5 mm., tips not exserted, feathery part very obtuse in outline. Pale broader than long, truncate, nerveless. Lodicles very obtuse. Anthers 4 mm. long.

TYPE SPECIMEN.

The type is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Bamboo Aristida. Bamboo grass. Hay grass. Heidegras. Hooigras. Stechgras. Steekgras. Steekriet. Steekweek.

ECONOMIC NOTES.

This species is reported to be of value as a sandstay and thus may prove useful in combating erosion. Although the foliage is very coarse and prickly, Pearson states that it is "much eaten by stock" whereas Pillans states that it "does not provide grazing". It is furthermore occasionally used for thatching.

5. A. Schlechteri Henrard Crit. Rev. 3. 541 (1928); Henrard Monogr. 1. 40 et 51 cum ic. tab. 1 (1929).

A hybrid between *A. capensis* Thunb. and *A. ciliata* Desf. var. *capensis* Trin. et Rupr. and agreeing in vegetative characters with the former. Caespitose perennial. Culms up to 40 cm. high, but sometimes much shorter, 2-noded. Internodes exserted, terete, somewhat striate, glabrous; nodes ciliate with spreading white hairs. Leaf-sheaths tight, striate, glabrous. Ligule a ciliolate rim; auricles bearded, collar glabrous. Leaves mostly basal, rather short, up to 14 cm. long, but usually about 6 cm. long, flexuous and curved, subrigid, setaceous, convolute, striate and glabrous below, hairy above. Panicle exserted, strictly erect, few-flowered; branches erect or ascending, scaberulous or smooth; pedicels slightly scabrous, spikelets lanceolate. Glumes firm and chartaceous, 3-nerved, yellowish, purple-flushed at the base, subequal to unequal, acute or subobtuse with minutely ciliolate tips; the lower 11-13.5 mm. long; the upper 13-16 mm. long. Articulation of the lemma 7-7.5 mm. from the base of the callus. Lemma smooth. Callus very acute, hairy, about 2-2.5 mm. long. Column of awns slightly to strongly twisted, about 7-9 mm. long, glabrous. Central awn 3.5-4 cm. long, feathery all along to the very tip, obtuse in outline; lateral awns 1.8-2.6 cm. long, naked or sparingly plumose, often one of these plumose and the other naked, tips long-exserted, rather fine.

CAPE PROVINCE.

Little Namaqualand distr.: Windhoek, VII., 1896, Schlechter 8338 (A, B, BH, G, K, N, P, T, V, W, Z).

REMARKS.

Henrard states the position of the articulation to be variable, but I have made many measurements and found this variation negligible. The articulation is situated 7-7 5 mm. from the end of the callus. It is moreover the length of the column of the lemma which shows some variation (7-9 mm.), and this is probably due to the discrepancies which Henrard mentions in regard to the position of the articulation. The length of the column of the lemma is usually fairly variable even in spikelets of one and the same panicle. See also *A. subacaulis* where the length of the column is extremely variable.

6. *A. ciliata* Desf. var. *capensis* Trin. et Rupr. × A. ?

The number cited below consists of two sheets which undoubtedly represents a hybrid.

The plants superficially resemble *A. ciliata* Desf. var. *capensis* Trin. et Rupr. as the nodes are strongly ciliate with reflexed or spreading white hairs, the glumes are subequal, obtuse or truncate, and minutely ciliate at their apices, and they are furthermore slightly discoloured (purple?) at the base. The lemmas however disagree with the aforementioned species as the callus shows a great deal of variation in its degree of hairiness. It shows all intermediates from being densely bearded to being perfectly glabrous. The body of the lemma may show the presence of an articulation as in typical members of § *Schistachne*. The majority of lemmas however show no signs of an articulation and in this respect they agree with members placed in § *Chaetaria*. All three awns of the lemma are plumose and acute in outline. The awns are fairly rigid and have almost naked exserted tips, and in this respect are not unlike those of *A. capensis* Thunb. There are, however, no other characters which would suggest a relationship with the last-mentioned species. Owing to the plumose awns this hybrid bears some resemblance to *A. sericans* Hack. but differs from the latter in a number of important characters, viz. bearded nodes, obtuse and glabrous glumes, etc. To suggest *A. sericans* Hack. as the other parent is unwarranted since the former appears to be restricted to the High Veld area of the Transvaal and therefore almost certainly does not occur in the dry arid regions of the Kenhardt District.

CAPE PROVINCE.

Austr. 178 (1841); Presl, Bot. Bemerk. 121 (1844).

Perennial, compactly caespitose, branched from near the base. Innovations forming dense tufts. *Culms* up to 85 cm. high but usually much shorter, densely tufted, fascicled, erect or somewhat geniculately ascending from a well-developed rootstock, simple, 2-3-noded; internodes terete, nearly smooth, with a viscous ring below the nodes, slightly

striate, somewhat swollen near the nodes, exserted; *nodes long-bearded with spreading hairs, the hairs often deciduous in old culms.* Lower leaf-sheaths crowded at the base, very broad, pallid or whitish, firm and persistent, striate, glabrous or more or less woolly along the margins; upper leaf-sheaths tight, shorter than the internodes, striate, glabrous or slightly pubescent; *ligule* a short ciliate rim, auricles shortly ciliate, those of the innovations conspicuously bearded; collar glabrous; *blades* striate, glabrous and smooth beneath, minutely hairy or hirtellous on the upper surface, convolute throughout, coarsely setaceous to pungent (when short) more or less recurved, variable in length, up to 25 cm. long but usually very much shorter. *Panicle* exserted, up to 30 cm. long, narrow but open and sometimes very loose, usually contracted and erect; axis terete or subcompressed, at times striate, glabrous; branches filiform, erect or sub-erect, solitary or usually 2-3-nate, up to about 8 cm. long exclusive of the awns, often branched from near the base; pedicels glabrous, shorter to longer than the glumes, clavate at the apex. *Spikelets* linear-oblong, pale or straw-coloured, often suffused with purple at the base. *Glumes* subequal, linear-oblong, 3-nerved, glabrous, obtuse or subacute, very firm, emarginate and usually minutely ciliolate at the apex; the lower from 8.5-11 mm. long, the upper 9-12 mm. long. *Lemma* tubulous, glabrous, smooth, gradually narrowed into a slender, twisted column of a somewhat variable length, articulated 5-7 mm. from the base of the callus, 10.5-14 mm. long up to the branching-point of the awn; *callus* long-hairy, very acute, from 1.5-2.5 mm. long; central awn 4-5 cm. long, naked in lower quarter, feathery part obtuse in outline, with a short naked or minutely plumose exserted tip; lateral awns very fine, usually sub-erect, 1.5-2.5 cm. long, sometimes slightly but inconspicuously plumose in their upper part. *Anthers* 5-5.5 mm. long.

ORANGE FREE STATE.

Bloemfontein distr.: Near Bloemfontein, IV. 1928, *Pole Evans* 2190 (N).

TYPE SPECIMEN.

Drège from Dweka and Zwartbulletje is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Bushman Grass. Dwa-gras. Groot Boesmangras. Grosses Toagras. Habugras. Kortbeen Twaa. Langbeen Twaa. Ochsengras. Tall Bushman Grass. Toagras.

ECONOMIC NOTES.

This species is considered a very good stock food, it is eagerly grazed by both sheep and cattle. It is said to be very drought-resistant, persists many months without rain and flowers readily after a minimum of rain.

7A. *A. ciliata* Desf. var. *villosa* Hack. in Bull. Herb. Boiss. **4** Append. III. 18 (1896); Stapf in Dyer, Fl. Cap. **7**. 564 (1899); Dinter in Fedde, Rep. **15**. 341 (1918); Henrard Crit. Rev. **1**. 95 (1926); Henrard Monogr. **1**. 42 (1929); Theron in Fedde, Rep. **40**. 10 (1936).

A. ciliata Desf. sec. F. Bolus in Ann. S. Afr. Mus. **9**. IV. 232 (1915) pro parte; Range in Fedde, Rep. **33**. 8 (1933) pro parte, non Desf. *A. prodigiosa* Welw. sec. Garabedian in Ann. S. Afr. Mus. **16**. II. 404 (1925) pro parte, non Welw.

This variety may be readily recognised by the possession of densely lanate or villous leaf-sheaths and leaf-blades. It appears to occur only in the very arid regions of South West Africa.

SOUTH WEST AFRICA.

Olukonda, XII. 1885, Schinz 649 (Z); Haikamchab, I. 1907, Galpin et Pearson 7413 (K, N, S); Marienthal-Orab, III. 1911, Dinter 2013 (B); Bei Lüderitzbucht, IX. 1913, Range 1883 (B); Angra Pequena, 1884, Schinz 663 (Z); do., I. 1907, Galpin et Pearson 7522 pro parte (K, S); Klinghardtgebirge, VIII. 1913, Schäfer 546 (B); Schakalskoppe, II. 1909, Pearson 4800 (K); between Aos and the Orange River, III. 1885, Schenck 327 (N, V, Z); Buntfeldschuh, IX. 1922, Dinter 3922 (B, N); North of Warmbad, II. 1909, Pearson 4301 (D, K).

TYPE SPECIMEN.

Schenck 327 both in the Botanisches Museum, Zürich and in the Naturhistorisches Museum, Wien.

ECONOMIC NOTES.

This variety is considered a good fodder grass for cattle and horses.

7b. **A. ciliata Desf. var. pectinata** Henr. Crit. Rev. **1**. 95 (1926); Henrard Monogr. **1**. 42 (1929); Theron in Fedde, Rep. **40**. 10 (1936).

This variety may be distinguished by the glumes both of which are always markedly ciliate with spreading hyaline hairs.

SOUTH WEST AFRICA.

Windhuk, 1906, *Bohr* 13 (B); Zwartbankberge (Kalkberge), IV. 1886, *Stapff* 9 [B (typus!), Z]; Aus, *Lewis* H. 19007 (N); Karubeam (Karabeam Mts. ?), VII. 1931, *Pillans* 6562 (BH).

CAPE PROVINCE.

Little Namaqualand distr.: Near Orange River mouth, VII. 1926, *Pillans* 5610 pro parte (BH, K); Clanwilliam distr.: Zoutrivistier, VII. 1896, *Schlechter* 8138 (A, B, BH); Herbert distr.: Read's Drift, III. 1937, *Acock* 4321 (Mc).

TYPE SPECIMEN.

Stapff 9 is deposited in the Botanisches Museum, Berlin—Dahlem.

COMMON NAMES.

Common Groot Boesmangras. Pferdegras.

ECONOMIC NOTE.

Stapff states it to be a meagre foddergrass after rain.

7c. **A. ciliata Desf. var. tricholaena** Hack. in Bull. Herb. Boiss. **4** Append. III. 18 (1896); *Stapf* in Dyer, Fl. Cap. **7**. 564 (1899); Dinter in Fedde, Rep. **15**. 341 (1918); Henrard Crit. Rev. **1**. 95 (1926); Henrard Monogr. **1**. 42 (1929); Range in Fedde, Rep. **33** 8 (1933).

A. ciliata Desf. sec. F. Bolus in Ann. S. Afr. Mus. **9**, IV. 232 (1915); *Stapf* in Dyer Fl. Cap. **7**. 563 (1899); Range in Fedde, Rep. **33**. 8 (1933) omnes pro parte non Desf.

This variety may be distinguished by the upper glume which is always markedly ciliate with spreading hyaline hairs. It is often found growing side by side with *A. ciliata* Desf. var. *capensis* Trin. et Rupr., the prevalent variety of this species in South Africa.

SOUTH WEST AFRICA.

ORANGE FREE STATE.

Fauresmith distr.: Jagersfontein, IV. 1920, *Van der Walt* H. 19805 (N, W) et *van Breda* 31 (N).

TYPE SPECIMEN.

Schenck 10 is deposited in the Naturhistorisches Museum, Wien. A duplicate is deposited in the Botanisches Museum, Zürich.

COMMON NAMES.

Beesgras. Groot Twaagras. Tall Bushman Grass.

ECONOMIC NOTES.

This variety is considered to be a good foddergrass.

8. **A. Schaeferi Mez** in Fedde, Rep. **17**. 152 (1921); Garabedian in Ann. S. Afr. Mus. **16**. 404 (1925); Henrard Crit. Rev. **3**. 535 (1928); Henrard Monogr. **1**. 41 cum. ic. tab. 2 (1929); Theron in Fedde, Rep. **40**. 11 (1936).

A. ciliata Desf. var. sec. F. Bolus in Ann. S. Afr. Mus. **9**. IV. 232 (1915). *A. prodigiosa* Welw. sec. Hack. in Bull. Herb. Boiss. **4**. Append. III. 19 (1896); Garabedian in Ann. S. Afr. Mus. **16**. II. 404 (1925) pro parte; Dinter in Fedde, Rep. **15**. 342 (1918); omnes non Welw.

Perennial, compactly caespitose, branched from the base. Innovations forming rather short and dense tufts. *Culms* up to 65 cm. high but usually much smaller, densely tufted, fascicled, erect or somewhat geniculately ascending from a robust almost suffrutescent rootstock, simple, 2-3-noded; internodes terete, smooth, slightly striate, swollen and often viscous just below the nodes, usually exserted; *nodes perfectly smooth and glabrous*. Lower *leaf-sheaths* short, densely lanate, striate, at length becoming glabrous and shiny, with well-developed hyaline margins; the upper shorter than or as long as the internodes, scabrous or shortly pubescent especially along the margins, striate; *ligule* a short hairy rim; auricles pubescent or very shortly ciliate, collar glabrous; *blades* striate, nearly glabrous beneath, densely shortly villous-pubescent on the upper surface, terminating in a pungent apex; those of innovations 1-2 cm., or up to 8 cm. long, recurved, firm subulate; those of the culm leaves up to 12 cm. long. *Panicle* exserted, or at first sheathed by the uppermost leaf, up to 26 cm. long, somewhat contracted but loose; axis terete or sub-compressed, striate or grooved upwards, almost smooth; branches filiform, erect or sub-erect, solitary or 2-3-nate, up to 8 cm. long exclusive of the awns, often branched from near the base; pedicels nearly glabrous, at times almost as long as the glumes, swollen towards the apex (clavate). *Spikelets* straw-coloured, usually flushed with purple near the base. *Glumes* about equal, boat-shaped, 3-nerved, glabrous or sometimes rigidly ciliate, very firm, both 8.5-12.5 mm. long. *Lemna* tubulous, glabrous, smooth, 9-10.5 mm. long, articulated 6-6.5 mm. from the base of the callus; *callus* long-hairy, acute from 1.75-2 mm. long; central awn 4-4.5 cm. long, naked in lower third, plumose above nearly to the tip, the latter short, naked and exserted, the feathery part subacute in outline; lateral awns naked, from 1.3-2.2 cm. long. *Anthers* 5.5-6.0 mm. long.

SOUTH WEST AFRICA.

Lower Swakop, IV. 1886, *Marloth* 1203 pro parte (N); Rössingberge, XI. 1938, *Volk* 19 (D) et 26 (D); Tsauchab, II. 1909, *Pearson* 4949 (K); Lüderitzbucht (Angra Pequena), I. 1907, *Galpin et Pearson* 7583 (K); do., XI. 1908, *Marloth* 4667 (K) et IV. 1909, *Marloth* 4742 pro parte (N); do., *Schinz* 664 (Z) et *Schinz* s.n. (V); do., *Peyer* s.n. (Z); do., IV. 1929, *Dinter* in Hb. Stell. 10790 (St); Pomona, VI. 1929, *Dinter* 6421 (B, BH, D, G, K, St); do., X. 1913, *Schäfer* 549 (B, N).

TYPE SPECIMEN.

Schäfer 549 is deposited in the Botanisches Museum, Berlin-Dahlem.

REMARKS.

This species superficially resembles *A. ciliata* Desf. var. *capensis* Trin. et Rupr. but can be readily recognised by the beardless nodes and the firm subulate leaf-blades.

- 8a. **A. Schaeferi** Mez var. *biseriata* Henrard Monogr. 1. 41 (1929); Henrard Crit. Rev. Suppl. 739 (1933).

In general appearance this variety resembles the species but may readily be distinguished by having shorter glumes, of which the upper (gluma II) is dorsally rigidly ciliate with long hyaline hairs.

SOUTH WEST AFRICA.

Welwitsch, I. 1907, *Galpin et Pearson* 7590 (N, K, S, V).

TYPE SPECIMEN.

The type specimen is deposited in the Naturhistorisches Museum, Wien.

REMARKS.

This variety is only known so far from the type gathering. It is apparently not at all a common plant.

9. **A. Dinteri** Hack. in Bull. Herb. Boiss. Ser. II. 1. 767 (1901); Dinter in Fedde, Rep. 15. 341 (1918); Garabedian in Ann. S. Afr. Mus. 16. II. 401 (1925); Henrard Crit. Rev. 1. 143 (1926); Henrard Monogr. 1. 45 cum ic. tab. 4 (1929); Theron in Fedde, Rep. 40. 8 (1936).

A. coma-ardeae Mez in Fedde, Rep. 17. 152 (1921); Garabedian in Ann. S. Afr. Mus. 16. II. 401 (1925); Henrard Crit. Rev. 1. 106 (1926). *Aristida* sp. nearest *A. plumosa* Linn. sec. F. Bolus in Ann. S. Afr. Mus. 9. IV. 235 (1915).

Densely caespitose erect glaucous *perennial* with intravaginal innovation shoots. *Culms* erect, often somewhat geniculate at the nodes, elegant, up to 40 cm. high, simple, 2-4-noded, the glabrous nodes equally distributed; internodes terete, scarcely striate, slightly thickened and grooved below the nodes and with depressed crateriform glands (which are more readily visible on old culms), smooth or scaberulous. *Sheaths* of the lower blades more or less reduced, 1-3 cm. long, rather thin, sometimes papery, densely striate, scabrous, pallid with broad hyaline margins; the upper tight, terete, scaberulous or scabrous especially along the margins, striate, at times slightly keeled, shorter than the internodes; *ligule* a ciliolate rim; auricles densely ciliate and more or less bearded or the long hairs wanting; collar glabrous; *blades* erect or very laxly curled, linear not very rigid, setaceous convolute throughout, about 1 mm. wide when expanded, acuminate, about 12-15 cm. long, very scabrous on both surfaces and hirtellous on the upper surface, terminating in a setaceous point. *Panicle* erect, linear, rather narrow, but very lax and interrupted at the base, up to 20 cm. long including the spikelets and awns, just exserted or more or less sheathed by the uppermost leaf; axis terete and nearly smooth below, like the lower branches usually with depressed crateriform glands, upwards more or less angular and scabrous, striate; branches solitary or binate, scaberulous or nearly smooth, up to 10 mm. long, each bearing 1-3 erect adpressed spikelets on secondary branchlets (pedicels); pedicels very short, nearly sessile or up to 3 mm. long, always shorter than the glumes, scabrous, laterally grooved and slightly thickened. *Spikelets* strictly erect, whitish, glumes linear-lanceolate, about equal or slightly unequal, the lower 12-15 mm. long, 3-nerved or sub-5-nerved, acute, shortly awned, more or less hairy with soft spreading hairs, the upper glume 12-16 mm. long, narrower than the lower, 3- or 5-nerved, acute or with an inrolled subobtuse apex, less hairy than the lower glume. *Lemma* glabrous, linear-tubular, body of the lemma

from base of callus up to the branching-point of the awn 16–18 mm. long, the articulation 5–5·5 mm. from the base of the callus, the body gradually narrowed into a smooth distinctly twisted column about 4 mm. long; *callus* 1·5 mm. long, very acute; central awn spreading, from 5·5–7·0 cm. long, naked in the lower quarter part, densely plumose above, with a shortly excurrent naked tip, the feathery part acute to sub-acute in outline; lateral awns very delicate and thin, suberect, naked, from 14–18 mm. long. *Anthers* 5·5–6·0 mm. long.

SOUTH WEST AFRICA.

Haigamkhab, I. 1904, *Pearson* 503 (K); do., I. 1907, *Galpin et Pearson* 7434 (K, N) et 7436 (K, N, S); Khan River, III. 1900, *Dinter* 1485 (N, Z); Welwitsch, I. 1907, *Galpin et Pearson* 7416 (B, K, N, S) et 7419 (B, K, N, S); do., III. 1909, *Pearson* 4416 (BH, K) et 4418 (BH, K).

TYPE SPECIMEN.

Dinter 1485 is deposited in the Botanisches Museum, Zürich.

10. **A. prodigiosa** *Welw.* in Trans. Linn. Soc. **27**. 80 cum tab. 25 (1869); Dur. et Schinz, Conspl. **5**. 807 (1894); *Welw.* Cat. Afr. Pl. **2**. I. 205 (1899) pro parte; Hennard Crit. Rev. **2**. 464 (1927); Hennard Monogr. **1**. 44 cum ic. tab. 3 (1929).

Perennial, densely caespitose. *Culms* up to 50 cm. high, erect, simple, 2–4-noded; nodes constricted, glabrous; internodes terete and somewhat striate. *Leaf-sheaths* glaucous, glabrous or puberulous; *ligule* a ciliate rim, the auricles bearded, collar glabrous; *blades* up to 10 cm. long, curved or suberect, convolute, sulcate-striate, puberulous on both surfaces. *Panicle* erect, rather loose, linear-oblong in outline, up to 30 cm. long; axis compressed or angulate, glabrous; branches usually solitary, branched from near the base. *Spikelets* pale, yellow or greenish, purple at the base. *Glumes* subequal, keeled and acute, hairy all over, or glabrous at the margins and the apex, the hairs very soft and spreading; the lower 7 mm., the upper 8 mm. long. *Lemma* including callus and column up to branching-point of the awn 6–7 mm. long; *callus* very acute, densely hairy, about 2 mm. long; central awn naked at the base, up to 2 cm. long, scarcely feathery at the tip; lateral awns naked, spreading, ± 1 cm. long.

ANGOLA.

Cabo negro, IX. 1859, *Welwitsch* 2000a (K, N); Mossamedes, IV. 1909, *Pearson* 2276 (K, N).

TYPE SPECIMEN.

Welwitsch 2000a is deposited in the British Museum (Natural History), London.

REMARKS.

Although this species has so far not been found to occur in South West Africa, it is within the bounds of likelihood that it does actually grow in the extreme north-western coastal part of that region, which from a botanical point of view is as yet almost unexplored.

- 10a. **A. prodigiosa** *Welw.* var. **calva** Hennard Crit. Rev. **3**. 467 (1928); Hennard Monogr. **1**. 44 (1929);

A. prodigiosa *Welw.* Cat. Afr. Pl. **2**. I. 205 (1899) pro parte.

The variety resembles the species very closely but may be easily distinguished by possessing glabrous glumes. The same general remarks with regard to the species apply to this variety.

ANGOLA.

Near Mossamedes, IV. 1909, Pearson 2247 (K) ; between Mossamedes and R. Coroca, IV. 1909, Pearson 2248 (K) ; along Mossamedes railway, IV. 1909, Pearson 2881 (K).

TYPE SPECIMEN.

Pearson 2881 is deposited in The Herbarium, Royal Bot. Gardens, Kew.

11. **A. capensis** Thunb. (sensu lato).

Perennial, compactly caespitose, glabrous. *Culms* simple, very rarely branched from the base, erect, up to 75 cm. high, wiry, smooth or scaberulous, 1-2-noded. *Leaf-sheaths* firm, glabrous, scaberulous or with a few scattered hairs, striate, shorter than the internodes ; *ligule* a ciliate membrane ; auricles glabrous or bearded ; collar glabrous ; *blades* filiform, convolute, up to 40 cm. long, at times overtopping the panicle, firm, at times flexuous, lower surface smooth, upper surface scaberulous to hispid. *Panicle* erect or more or less nodding, contracted, loose or effuse, somewhat secund, up to 30 cm. or more long ; branches solitary, often branched from the base, branchlets ultimately capillary or filiform. Pedicels clavate. *Spikelets* erect or nodding, pale brown to purple. *Glumes* glabrous or hairy, unequal to subequal, linear-lanceolate ; the lower 10-19 mm. long, the upper 11-20 mm. long. *Lemma* including the callus 5-8.5 mm. long, tubulous, dorsally smooth or pustulate ; *callus* very acute, densely hairy, about 2.5 mm. long ; column 1-14 mm. long, glabrous or hairy, usually twisted, shorter than or exceeding the glumes ; awns unequal, the central 16-40 mm. long, the lateral 13-35 mm. long.

The above description has been drawn up so as to include the material enumerated under the following varieties. The salient points characterising each variety are enumerated separately under each of these varieties.

11a. **A. capensis** Thunb. var. *genuina* Henrard Crit. Rev. **1**. 77 (1926) ; Henrard Monogr. **1**. 50 cum ic. tab. 6 (1929).

A. capensis Thunb. Prodr. 19 (1794) ; Kunth Enum. **1**. 95 (1833). *Chaetaria capensis* (Thunb.) Beauv. Agrostogr. 30 (1812) ; Roem. et Schult. Syst. Veg. **2**. 395 (1817).

This variety may be distinguished by the glabrous column of the awns which is usually shorter than the glumes ; at times however it exceeds the glumes by 1-2 mm. The feathers of the awns are white or canescent.

CAPE PROVINCE.

Malmesbury distr. : Darling, IX. 1905, Bolus 12910 (BH, N). Worcester distr. : Hex River Valley, X. 1881, Tyson 610 (A, K).

TYPE SPECIMEN.

Specimen β of *Thunberg* in Herb. Thunberg, Upsala, Sweden.

11b. **A. capensis** Thunb. var. *macropus* (Nees) Trin. et Rupr. Spec. Gram. Stip. 179 (1842) ; Walp. Ann. Bot. **3**. 751 (1852) ; Dur. et Schinz, Consp. **5**. 801 (1894) ; Stapf in Dyer, Fl. Cap. **7**. 565 (1899) ; F. Bolus in Ann. S. Afr. Mus. **9**. IV. 233 (1915) ; Henrard Crit. Rev. **1**. 78 (1926) ; Henrard Monogr. **1**. 50 cum ic. tab. 7 (1929) ; Theron in Fedde, Rep. **40**. 16 (1936).

A. capensis Thunb. var. *fulviberbis* Trin. et Rupr. Spec. Gram. Stip. 179 (1842) ; Walp. Ann. Bot. **3**. 751 (1852) ; Dur. et Schinz, Consp. **5**. 801 (1894) ; Henrard Crit. Rev. **1**. 78 (1926). *A. capensis* Thunb. var. *Zeyheri* Trin. et Rupr. sec. Stapf in Dyer, Fl. Cap. **7**. 565 (1899) pro parte, excl. syn., non Trin. et Rupr. *Arthratherum capense* Nees var. *macropus* Nees, Fl. Afr. Austr. 176 (1841).

In this variety the column of the awns is glabrous and usually much exceeds the glumes. The feathers of the awns are bright yellow.

CAPE PROVINCE.

Little Namaqualand distr. : Kamiesberg, *Drège* 2544 (B) ; do., IX. 1911, *Pearson* 6499 (BH, K) ; Hondeklip Bay, X. 1924, *Pillans* 18266 (BH) ; between Goedemanskraal and Kaus, *Drège* (N) ; between Kuil and Modderfontein, *Drège* (G, S). Van Rhynsdorp distr. : near Ebenezer, *Drège* (B, K, P) ; Van Rhynsdorp, XI. 1923, *Rood* 789 (N) ; do., IX. 1900, *Diels* 527 (B). Clanwilliam distr. : Karreebergen, VII, 1896, *Schlechter* 8213 (A, B, BH, BM, G, K, N, P, T, V, W, Z) ; Haasdrift, IX. 1925, *Levyns* 1278 (U) ; without exact locality, *Leipoldt* 336 (S) ; *Drège* (B, O) ; *Morris* BH. 21792 (BH) ; *Thunberg* (BM).

TYPE SPECIMEN.

Several sheets (leg. *Drège*, et *Ecklon*) together constituting the type are deposited in the Botanisches Museum, Berlin-Dahlem.

REMARKS.

Thunberg's gathering in the British Museum consists of a specimen in which the spikelets show the presence of a well-exserted naked column. Furthermore the awns are yellow-plumose. This sheet may thus not be considered a duplicate of the type of *A. capensis* var. *genuina* Henrard.

11c. *A. capensis Thunb. var. Dieterleniana H. G. Schweickerdt* in *Kew Bull.* 1939. p. 653.
a typo glumis subaequalibus extra pubescensbusque valde distincta.

The softly hairy glumes readily distinguish this variety from any of the others.

BASUTOLAND.

Leribe distr. : Maluti Mountains, *Staples* 146 (N). Quthing distr. : Leloaleng, I. 1916, *Dieterlen* 1205 (K, N, P).

ORANGE FREE STATE.

Ladybrand distr. : Westminster, III. 1934, *Celliers* 11 (K, N).

TYPE SPECIMEN.

Celliers 11 is deposited in the National Herbarium, Pretoria.

ECONOMIC NOTES.

This variety is reported to be unpalatable.

REMARKS.

This variety superficially bears great resemblance to *A. sericans* Hack. with which species it might easily be confused. The lemma of the latter however is not articulated and it is thus that one may readily distinguish between these two plants.

11d. *A. capensis Thunb. var. barbata Stapf* in Dyer, *Fl. Cap.* 7. 565 (1899) ; Henrard Crit. Rev. 1. 77 (1926) ; Henrard Monogr. 1. 50 cum ic. tab. 6 (1929) ; Theron in Fedde, Rep. 40. 16 (1936).

This variety is characterised by possessing a hairy column of the awns, furthermore by well developed leaves which usually overtop the panicle.

CAPE PROVINCE.

Uitenhage distr. : Near mouth of Zwartkops Rivier, *Zeyher* 4501 (B, K, N, P, V) ; between Kouga and Zwartkops Rivier, *Zeyher* 4501 (A, K, S, St, Z). Port Elizabeth distr. : Humewood, XI. 1907, *Rosenbroek* 671 (B) ; Schoenmakerskop, III. 1910, *Paterson* 989 (A) ; do., XI. 1907, *Rosenbroek* 627 (B) ; near Port Elizabeth, *Ecklon et Zeyher* 502 (BH, BM, K, O, S, V, Z) ; do., V. 1896, *Kemsley* 317 (A). Alexandria distr. : VIII. 1912, *Burtt Davy* 14196 (N). Bathurst distr. : Port Alfred, *Hutton* 11 (A) et 11a (A, B, BH,

D, N, S, T, Z); do., X. 1916, *Tyson* BH 14877 (D, K, N, T); do., XI. 1922, *Britten* 2994 (A); do., VII. 1914, *Salisbury* 109 (WR, Z). East London distr.: East London, IV. 1903, *Galpin* 6557 (A, BH). Kentani distr.: Kei-mouth, V. 1893, *Flanagan* 1782 (BH, N, S); Gogwana River mouth, *Pegler* 265 (A, BH, N, Z). Without precise locality: *Pappe* s.n. (BM).

TYPE SPECIMEN.

The syn-types are all deposited in The Herbarium, Royal Bot. Gardens, Kew.

REMARKS.

This variety appears to have a well-defined geographic distribution, being restricted (or almost so) to the coastal areas of the Eastern Cape.

11e. *A. capensis* Thunb. var. *canescens* Trin. et Rupr. Spec. Gram. Stip. 178 (1842); Walp. Ann. Bot. 3. 751 (1852); Dur. et Schinz, Conspl. 5. 801 (1894); Hennard Crit. Rev. 1. 77 (1926); Hennard Monogr. 1. 51 cum ic. tab. 6 (1929).

A. capensis Thunb. sec. F. Bolus in Ann. S. Afr. Mus. 9. IV. 233 (1915). *A. capensis* Thunb. var. *Zeyheri* (Nees) Walp. Ann. Bot. 3. 751 (1852); Dur. et Schinz, Conspl. 5. 801 (1894); Staaf in Dyer, Fl. Cap. 7. 565 (1899); Hennard Crit. Rev. 1. 79 (1926); Hennard Monogr. 1. 51 cum ic. tab. 7 (1929). *A. Zeyheri* (Nees) Steud. Nomencl. Bot. ed. 2. 1. 132 (1841); Hennard Crit. Rev. 3. 686 (1928). *Arthratherum Zeyheri* Nees, Fl. Afr. Austr. 177 (1841).

This variety is distinguished by the hairy column up to 12 mm. long, glabrous glumes, and a panicle which is not overtopped by the leaves.

TYPE SPECIMEN.

Bergius s.n. is deposited in the Trinius Herbarium, Leningrad.

REMARKS.

The sheets enumerated under this variety by no means form a homogeneous unit. There is a great deal of variation in the length of the glumes and column of the awns.

There appears to be a gradual transition from *var. Zeyheri* to *var. canescens* and I have not been successful in distinguishing clearly between the two "varieties". For this reason a broader conception of the variety has been taken, and *var. Zeyheri* has been sunk in synonymy.

The specimens enumerated here are the more common form of the species and appear to be centred around the Cape Peninsula or in the coastal areas south-east from there.

12. **A. damarensis** Mez in Fedde, Rep. **17**. 152 (1921); Garabedian in Ann. S. Afr. Mus. **16**. II. 401 (1925); Henrard Crit. Rev. **1**. 130 (1926); Henrard Monogr. **1**. 53 cum ic. tab. 8 (1929); Theron in Fedde, Rep. **40**. 14 (1936).

Perennial, laxly caespitose, robust, up to 1·2 metres high, branched from near the base. Innovations intravaginal. *Culms* simple, erect, 2 mm. in diam. at the base, 3-4-noded; nodes equally distributed, slightly constricted; internodes terete, glabrous and smooth, minutely striate, exserted. Lower *leaf-sheaths* distichous and flabellate, gaping, yellow, striate, glabrous, rounded on the back, up to 6 cm. long, margins hyaline sometimes hairy; the upper leaf-sheaths much longer, up to 15 cm. long, tight, terete, striate, glabrous, minutely pubescent along the margins, scaberulous between the nerves, shorter than the internodes; *ligule* a minutely but densely ciliolate rim; auricles thickened, pubescent, those of the innovations long-bearded; *blades* of the culm-leaves very firm, almost junciform, the lower fairly short (\pm 8 cm. long), the upper up to 40 cm. long, narrowly convolute, glaucous, glabrous, striate, scaberulous along the furrows beneath, upper surface scabrous, up to 3 mm. wide, narrowed into a pungent tip; blades of the innovations shorter, the margins more conspicuously pubescent above. *Panicle* sheathed at the base by the uppermost leaf, about 45 cm. long, rather narrow, contracted but not very dense or spike-like; axis subterete, deeply striate (grooved), glabrous, angular upwards; branches solitary to 3-nate, the longer ones 6-8 cm., 10-12-flowered, naked at the base, erect and adpressed, scaberulous; pedicels subclavate, shorter or slightly longer than the glumes. *Spikelets* erect, pallid or yellow. *Glumes* with an inverse position, almost glabrous, scabrous or minutely pilose towards the apex and margins; the lower 3-5-nerved, abruptly narrowed into the short muero, 12-17 mm. long; the upper 3-nerved, the keel scabrous upwards, 12-14 mm. long, tip subacute or truncate with a short mucro. *Lemma* glabrous, including the callus about 5-6·5 mm. long; *callus* rather blunt, 1 mm. long, hairy; column of awns 5-7 mm. long; central awn densely long-plumose, obtuse in outline, without an exserted tip, 15-22 mm. long; lateral awns plumose, 9-15 mm. long. *Anthers* 5-6·5 mm. long.

SOUTH WEST AFRICA.

Khan-Schlucht, II. 1936, Boss TM. 35640 et NH. 21076 (K, N, T); Haigamkhab, I. 1907, Galpin et Pearson 7577 (B, K, N, S); about 30 miles from Swakopmund, XII. 1929, Moss 17837 (N, WR).

TYPE SPECIMEN.

Galpin et Pearson 7577 is deposited in the Botanisches Museum, Berlin-Dahlem.

13. **A. sabulicola** Pilger in Engl. Bot. Jahrb. **40**. 81 (1908); F. Bolus in Ann. S. Afr. Mus. **9**. IV. 235 (1915); Dinter in Fedde, Rep. **15**. 342 (1918); Garabedian in Ann. S. Afr. Mus. **16**. II. 404 (1925); Henrard Crit. Rev. **3**. 526 (1928); Henrard Monogr. **1**. 53 cum. ic. tab. 11 (1929); Range in Fedde, Rep. **33**. 9 (1933); Theron in Fedde, Rep. **40**. 17 (1936).

Perennial, very robust, tall and stiff, up to 2 metres high, from a much-branched vigorous rhizome. Subterranean branches developing in all directions, with scale-like leaves and fibrous roots at the nodes. *Culms* rigid, strictly erect, glabrous, fascicularly branched, with the branches erect; internodes included or exserted, glabrous or somewhat viscid just below or above the nodes (at the mouth of the leaf-sheaths?), sometimes with minute depressed cateriform glands?; nodes glabrous. *Leaf-sheaths* long, longer or shorter than

the internodes, tight, striate, glabrous, often with minute gland-like depressions between the nerves, the lower merely short scales; *ligule* a shortly ciliolate rim; auricles pubescent or almost glabrous; collar glabrous; *blades* very rigid, thick, stiffly erect, 25–40 cm. long, often much longer, involute or complicate, junciform, very acute and pungent, terete, smooth on lower surface, hirtellous or scabrous on the upper surface, many-nerved, the margins not thickened (when flattened out) up to 5 mm. broad at the base. *Panicle* shorter than the blades, narrow, densely spiciform, 10–30 cm. long, about 1–2 cm. broad at the base; branches short, divided and spikelet-bearing nearly from the base; the lower branches up to 5 cm. long, adpressed and more or less naked at the base. *Spikelets* densely congested, yellowish. *Glumes* quite smooth, slightly unequal, subobtuse or acute; the lower 3-nerved, 8–11 mm. long; the upper 1-nerved, 9–12 mm. long. *Lemma* punctulate or smooth, including the callus 4·75–6 mm. long; *callus* pungent, very acute, curved, about 1·5 mm. long, densely bearded, especially above; column very short, 1–1·5 mm. long. Awns subequal, densely plumose to the tips, 5·5–10 mm. long, acutish in outline, the central usually somewhat longer than the lateral; branching point of awns produced into 2 thin, hairy appendages, bearing a pencil of hairs at the subobtuse tips. *Caryopsis* 4 mm. long, 1 mm. broad, spindle-shaped, anteriorly compressed; scutellum about one-third as long as the fruit.

SOUTH WEST AFRICA.

Rotkop, II. 1929, Dinter 6009 (B, BH, D, G, K, St); north of Rotkuppe Station, II. 1909, Pearson 4185 (BH, K); Haris, I. 1907, Range 174 (B) et 179 (B); Kuisebthal, IV. 1886, Stapff 10 et 11 (B); in the Kuiseb River at Walfishbay, VII. 1888, Gürich 122 (B); Rooibank near Walfishbay, Schultze 379 (B); Schwarzbank along Kuiseb River, VII. 1888, Gürich 119 (B); Anichab, II. 1907, Range 209 (B, K); Anichab, III. 1907, Peyer 248 (Schäfer 248) (B, N, V); Lüderitzbucht, Peyer s.n. TYPE SPECIMEN.

The syn-types are deposited in the Botanisches Museum, Berlin-Dahlem. They are Schultze 379, Gürich 119 et 122.

ECONOMIC NOTES.

Used by the natives for plaiting mats. These are used to cover their huts. The mats easily imbibe moisture and thus become impervious to rain.

14. **A. Marlothii** Hack. in Engl. Bot. Jahrb. **11**. 400 (1889); Dur. et Schinz, Conspl. **5**. 804 (1894); Hack. in Bull. Herb. Boiss. **4** Append. III. 19 (1896); Staph in Dyer, Fl. Cap. **7**. 567 (1899); Henrard Crit. Rev. **2**. 334 (1927); Henrard Monogr. **1**. 82 cum ic. tab. 21 (1929); Theron in Fedde, Rep. **40**. 19 (1936).

A. lutescens Steud. var. *Marlothii* Staph in Dyer, Fl. Cap. **7**. 567 (1899); Dinter in Fedde, Rep. **15**. 342 (1918); Garabedian in Ann. S. Afr. Mus. **16**. II. 403 (1925). *A. lutescens* Steud. sec. Hack. in Bull. Herb. Boiss. **4**. Append. III. 18 (1896) pro parte; Dinter in Fedde, Rep. **15**. 342 (1918) non Steud. *A. lutescens* Trin. et Rupr. sec. Engler in Engl. Bot. Jahrb. **19**. 129 (1894). *A. namaquensis* (Nees) Trin. et Rupr. sec. Garabedian in Ann. S. Afr. Mus. **16**. II. 403 (1925); Range in Fedde, Rep. **33**. 8 (1933) pro parte, non (Nees) Trin. et Rupr.

Perennial, strictly erect, almost suffrutescent, with a thick rhizome. Innovations intravaginal, densely sheathed at the base by firm, reduced mucronate (blades!) scales. *Culms* erect (or somewhat ascending), simple, terete, glabrous, many-noded; internodes all included, or usually the upper 1 or 2 exserted, grooved or somewhat angular just below the nodes, glabrous; nodes bearded with conspicuous white hairs. *Leaves* congested at the base of the culms, glaucous; sheaths tight, terete, the lower longer and the upper usually shorter than the internodes, somewhat striate, glabrous; *ligule* a short ciliate rim; auricles glabrous or minutely ciliolate; collar glabrous; *blades* linear, acuminate, pungent,

3-7.5 cm. long, very rigid, spreading, often somewhat recurved, convolute and junciform, 1.5 mm. in diameter, glabrous and somewhat grooved beneath, puberulous on the upper surface, prominently equally 5-7-nerved. *Panicle* effuse, pyramidal, up to 25 cm. long, very lax and open; axis glabrous, angular and somewhat grooved upwards; branches filiform, glabrous, with distinct pencils of hairs in their axils, lower branches semi-whorled or subfascicled, often solitary, the longer branchlet in each branch 5-6-flowered, the others 2-3-flowered; pedicels glabrous, filiform, slightly thickened upwards, often flexuous or curved, as long as or longer than the glumes. *Spikelets* linear-lanceolate, yellowish or greenish. *Glumes* lanceolate, acuminate, shortly awned, glabrous, 3-nerved; the lower 10-12 mm. long, slightly scaberulous or hirtellous on the keel above; the upper from 12-14 mm. long, scaberulous upwards on the keel. *Lemma* linear-oblong, including the callus 6-8 mm. long; *callus* oblique, densely hairy, very acute, 2 mm. long; awns somewhat unequal, all plumose; column very short, about 0.5-1.5 mm. long, not twisted; central awn up to 20 mm. long, feathery to the very tip, obtuse in outline; lateral awns apparently naked, but seen under a strong lens distinctly plumose, or conspicuously so, from 12-15 mm. long. *Anthers* 4.5-5.5 mm. long.

SOUTH WEST AFRICA.

Near Haris, I. 1907, *Range* 181 (B); Sandfontein near Walvisbay, IV. 1886, *Marloth* 1176 (A, B, BH, K, S); Walfishbay, IV. 1905, *Schultze* 380 (B); Scheppmannsdorf, *Stapff* 13 (B); Schwarzbank along Kuiseb River, VII. 1888, *Cürich* 117 (B); Tsaukaib, XI. 1909, *Marloth* 4665 (K, N); Aus—Namib, X. 1910, *Marloth* 5002 (N); 50 Km. west of Kuibis, I. 1913, *Range* 1830 (B); Garub, III. 1908, *Kolonialamt* s.n. (B).

TYPE SPECIMEN.

Marloth 1176 is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Goa-gras. Stechgras. Löwengras.

ECONOMIC NOTES.

A good but scanty foddergrass as long as the shoots are green.

Rev.* 2. 316 (1927); *Henrard Monogr.* 1. 84 cum ic. tab. 22 (1929); *Range in Fedde, Rep.* 33. 9 (1933); *Theron in Fedde, Rep.* 40. 18 (1936).

Arthratherum lutescens Nees, *Fl. Afr. Austr.* 179 (1841); *Presl, Bot. Bemerk.* 121 (1844).

Perennial, with a creeping rhizome, covered like the base of the culms and the innovation-buds with scale-like pallid sheaths, usually much-branched. *Culms* erect, slender, fascicled, terete, glabrous and smooth, many-noded, up to 70 cm. long; internodes glabrous, terete, the upper usually exserted; nodes glabrous. Lowermost leaf-sheaths pallid, striate, glabrous or more or less hairy, with much-reduced blades; leaf-sheaths of the culms tight, glabrous, somewhat striate, the upper usually somewhat shorter than the internodes; *ligule* a ciliolate short rim; auricles minutely pubescent; collar glabrous; *blades* subulate, convolute and pungent, up to 12 cm. long but usually shorter, rigid, curved, spreading, glabrous and smooth beneath, puberulous and hirtellous on the upper surface. *Panicle* ovate or pyramidal, very lax and open, in depauperated specimens somewhat contracted, erect, up to 25 cm. long; rachis smooth; branches 2-3-nate or solitary and divided nearly from the base, remotely and sparsely branched, filiform, flexuous and smooth, the axils swollen and glabrous, lower branches up to 8 cm. long, few-flowered. *Pedicels* smooth, curved or flexuous, rather

long, those of the lateral spikelets shorter or more rarely as long as the glumes. *Spikelets* scattered, often nodding, light green or yellowish. *Glumes* lanceolate, unequal, gradually narrowed, not awned, with an obtuse, truncate or toothed apex, glabrous, 3-nerved, the lateral nerves not or scarcely anastomosing; the lower 9–11 mm. long; the upper 11·5–14 mm. long. *Lemma* subcylindric, rounded at the base, suddenly narrowed into the callus, including the latter 6–7 mm. long; *callus* 2–2·5 mm. long, shortly hairy, very acute; column of awns 2–5 mm. long, twisted; central awn up to 2·7 cm. long, scantily hairy at the base, densely plumose to the very tip, the feathery part acutish in outline; lateral awns 9–23 mm. long, very fine, apparently glabrous but scantily and adpressedly ciliate.

Arthratherum subacuale Nees, Fl. Afr. Austr. 180 (1841).

Annual, in small compact tufts, including the culms and awns up to 10·0 cm. high, but usually very much smaller. *Culms* minutely hairy, sheathed all along. *Sheaths* loose, the lowermost bladeless and resembling striate membranous scales, the upper markedly striate, scabrid above and with broad membranous margins; *ligule* a small ciliolate rim, auricles bearded, collar smooth; *blades* fairly short, setaceous convolute, up to 3 cm. long, about 1 mm. wide when expanded, strongly striate, asperulous on both surfaces, acute, sub-rigid, more or less curved. *Panicle* few-flowered, much reduced, contracted, almost hidden by the radical leaves, usually somewhat sheathed by the uppermost leaf and sub-exserted; *rhachis* and branches hispidulous; pedicels short, hispidulous or more or less pilose at the clavate tip. *Spikelets* whitish, erect. *Glumes* linear-lanceolate, acuminate, both 3-nerved, membranous, lateral nerves about half the length of the midrib, the latter slightly scabrous towards the apex; the lower 10–13 mm. long; the upper 8–10 mm. long. *Lemma* including the callus 3–4 mm. long, lanceolate-ovate, smooth and glabrous; *callus* very acute, about ± 1 mm. long, long-hairy; length of column of awn extremely variable (even in one and the same plant), 1–13 mm. long (spikelets near the base of the panicle have shorter columns than those situated nearer the apex), twisted; central awn plumose, slightly hairy at the base, scaberulous in lower part, plumose above the middle to the very tip, up to 4·3 cm. long; lateral awns very fine, up to 1·8 cm. long. *Anthers* 4 mm. long.

Drège from Verleptpram is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAME.

Muis-gras.

REMARKS.

The length of the column of the awn varies considerably, even in one and the same gathering. In *Dinter* 4104 it may be 4–13 mm., in *Dinter* 6301 from 5–10·5 mm., whereas in *Schenck* 32 it is only about 1 mm. long. In this species the length of the column is thus hardly of any taxonomic value.

A. subacaulis (Nees) Steud. sec. Stapf in Dyer, Fl. Cap. **7**. 568 (1899) ; Hack. in Bull. Herb. Boiss. **4**. Append. III. 19 (1896) ; Dinter in Fedde, Rep. **15**. 343 (1918) ; omnes pro parte, non (Nees) Steud.

Annual, laxly caespitose, up to 15 cm. high including the awns. Sterile innovations absent. Culms geniculately-ascending, 2–4-noded. Internodes subterete or angular, striate, densely but minutely pubescent, exserted, the upper included. Lower leaf-sheaths densely aggregated, loose, white and papery, about 1 cm. long, keeled, densely striate and hirtellous, especially on the nerves, margins shortly pilose or ciliolate, broad and hyaline ; upper leaf-sheaths much longer, up to 5 cm. long, very broad, inflated, loosely enveloping the internodes or part of the inflorescence, margins less ciliate, hyaline, striate and minutely scaberulous ; ligule a ciliolate rim ; auricles bearded ; collar constricted ; blades of all the leaves much reduced ; the lower spirally curved and twisted, scabrous-hirtellous on both surfaces, 1–2 cm. long, about 1 mm. wide at the base or somewhat broader, apex subobtuse ; the upper curved or straight and scarcely 1·5 cm. long, convolute, much narrower than the sheaths. Panicle scarcely exserted, partly sheathed by the uppermost sheath, ovate-oblong, dense, up to 8 cm. long including the awns ; axis striate, subterete, scabrous-hirtellous ; branches short, solitary, divided nearly from the base ; branchlets fascicled, short ; pedicels scabrous, axils pubescent, thickened towards the apex, shorter than the glumes. Spikelets pallid. Glumes narrowly lanceolate, acute, shortly awned 3-nerved, almost hyaline ; the lower 9–11·5 mm. long, densely but minutely scaberulous on the outer surface ; the upper 8–10 mm. long, glabrous at the base but minutely scaberulous towards the apex. Lemma punctulate-scabrous under a strong lens, including the callus 3·5–4 mm. long, linear-tubulous with a somewhat oblique articulation, apex minutely bi-lobed ; callus acute, densely hairy, about 1–1·25 mm. long ; column of awns very scabrous, twisted, pubescent at and below the branching point, extremely variable in length, from 1–10·5 mm. long even on the same specimens ; central awn scabrous in the lower third, plumose above, the tip sometimes slightly exserted but more usually not acute to subobtuse in outline, 2–4·0 cm. long ; lateral awns naked, very fine, 1–1·5 cm. long. Anthers ± 2 mm. long.

TYPE SPECIMEN.

Hermann 42 is deposited in the Botanisches Museum, Berlin-Dahlem.

REMARKS.

In this species the column of the awn is extremely variable as to its length. *Dinter* 6344 has spikelets in which the column is only 1 mm. long, whereas in *Pearson* 2265 the column varies from 3–10·5 mm. in length.

18. **A. geminifolia** (Nees) Trin. et Rupr. Spec. Gram. Stip. 169 (1842) ; Walp. Ann. Bot. 3. 749 (1852) ; Steud. Syn. Pl. Glum. 1. 144 (1854) [sphalm. geminiflora] ; Dur. et Schinz, Consp. 5. 803 (1894) ; Stapf in Dyer, Fl. Cap. 7. 570 (1899) ; Dinter in Fedde, Rep. 15. 341 (1918) ; Garabedian in Ann. S. Afr. Mus. 16. Rev. 1. 194 (1926) ; Henrard Monogr. 1. 66 cum ic. tab. 16 (1929) ; Range in Fedde, Rep. 33. 8 (1933) ; Theron in Fedde, Rep. 40. 26 (1936) [sphalm. geminiflora].

Stipagrostis geminifolia Nees, Fl. Afr. Austr. 173 (1841) ; Presl, Bot. Bemerk. 121 (1844).

Perennial, densely caespitose, branched from the base, almost suffrutescent, up to 25 cm. high including the awns. *Culms* erect or ascending, slender, glabrous or hairy below the panicle, rather few-noded, simple, terete, striate ; internodes very unequal, markedly striate ; the lower short, sheathed, included ; the following long exserted, up to 12 cm. long ; the next short to very short, 5–20 mm. long, enclosed or exserted ; the last slightly longer or equaling the former in length and usually shortly exserted, often geniculate. Innovations intravaginal with a similar alternation of short and long internodes ; nodes bearded or becoming glabrous with age. *Leaves* crowded near the base, the uppermost again approximate, sometimes subopposite ; sheaths short, striate with much reduced leaf-blades, the lower tight and parched, glabrous, with woolly or ciliate margins, the upper less tight and almost spathelike, sometimes slightly hirsute with tubercle-based hairs ; *ligule* a ciliolate rim ; auricles bearded ; collar glabrous ; blades short, almost rudimentary, subulate, involute, subpungent, 3–10 mm. long, rarely longer, very rigid and divaricately spreading, striate and glabrous below, pubescent on the upper surface. *Panicle* sub-erect or somewhat nodding, very short, spike-like and often secund, including the awns up to 4 cm. long and 2·5 cm. broad ; rhachis glabrous or hairy, branched from near the base ; branches hairy ; pedicels hairy, very short, almost sessile. *Spikelets* crowded and congested yellowish-brown and tinged with purple. *Glumes* unequal, linear-lanceolate, acuminate, long-awned, the tips of both convolute and slightly bifid, but the setulae inconspicuous ; the lower 8–12 mm. long, hirsute all over, manifestly 3-nerved ; the upper 10–12 mm. long, narrower, more or less glabrous at the base, hirsute above, 1–3-nerved. *Lemma* including the callus 4–6 mm. long, linear-oblong, smooth, pale or purplish, minutely bilobed ; *callus* about 1·5 mm. long, very acute, densely hairy ; column of awn 1–2 mm. long, slightly twisted ; central awn spreading, 18–30 mm. long, plumose, lower part shortly hairy, upper part long feathery to the very tip, obtuse in outline ; lateral awns naked, up to 15 mm. long. *Pale* emarginate, 2-nerved, 1 mm. long. *Anthers* 3–4 mm. long.

TYPE SPECIMEN.

Drège 2561 is deposited in the Botanisches Museum, Berlin-Dahlem.

19. *A. fastigiata* Hack. *apud Schinz* in Bull. Herb. Boiss. Ser. II. 1. 768 (1901) ; *Dinter* in Fedde, Rep. 15. 341 (1918) ; *Henrard Crit. Rev.* 1. 175 (1926) ; *Henrard Monogr.* 1. 67 cum ic. tab. 15 (1929) ; *Theron* in Fedde, Rep. 40. 27 (1936).
A. geminifolia (Nees) Trin. et Rupr. sec. F. Bolus in Ann. S. Afr. Mus. 9. IV. 234 (1915) ; Garabedian in Ann. S. Afr. Mus. 16. II. 402 (1925) omnes pro parte, non (Nees) Trin. et Rupr.

Perennial, fairly densely caespitose, with a much-branched thick rhizome. *Culms* arising in fascicles at intervals from the rhizome, elegant, erect or somewhat geniculately ascending, 4-5-noded, up to 35 cm. high, sheathed all along, simple, terete ; internodes more or less equal in length, exserted, only slightly striate, laterally sulcate, somewhat scaberulous ; nodes annular, densely bearded with long spreading white hairs. *Leaf-sheaths* (except the lowermost) much shorter than the internodes, terete, tight, striate, only slightly scabrous, with ciliate margins ; *ligule* a shortly ciliate rim ; auricles densely divaricately bearded ; collar glabrous ; blades linear-lanceolate, acute, gradually narrowed into a setaceous point, more or less curved, flat at the base and 2-3 mm. wide, convolute upwards, up to 12 cm. long, but usually much shorter, many-nerved, margins not thickened, scaberulous beneath, pubescent or densely hirtellous on the upper surface. *Panicle* well-exserted, more rarely sheathed by the uppermost leaf, slightly nodding or erect, more or less obovate, dense, few to many-flowered, subsecund and subfastigiate, including the awns up to 8 cm. long ; axis striate, scaberulous ; branches scabrous, solitary, scarcely 5 mm. long, bearded in the axils ; pedicels very short, hairy. *Spikelets* congested, greenish-white, often darker (brown) at the base. *Glumes* unequal, 3-nerved, hairy all over, the tips more or less glabrescent ; the lower 10-14 mm. long, acute ; the upper 14-18 mm. long, acuminate, with a minutely bifid apex and inrolled tips. *Lemma* oblong, smooth, bilobed at the apex, 5-5.5 mm. long including the callus ; *callus* 1.5-2 mm. long, densely hairy, very acute ; central awn 3-3.5 cm. long, feathery all over, obtuse in outline ; lateral awns naked, 1-2 cm. long. *Anthers* 5 mm. long.

SOUTH WEST AFRICA.

Namib, VI. 1936, *Boss* TM. 36148 (K, N, T) ; 12 km. west of Sandverhaar, II. 1909, *Pearson* 4600 (A, BH, BM, D, K, N, S) ; Inachab, XI. 1898, *Dinter* 1102 (B, N, V, W, Z) ; between Kalkfontein and Nakob, I. 1916, *Pearson* 9709 (BH, K, S).

TYPE SPECIMEN.

Dinter 1102 is deposited in the Botanisches Museum, Zürich.

REMARKS.

This species is closely related to *A. geminifolia* but is characterised by having the internodes more uniform in length and well-developed leaf-blades. In *A. geminifolia* the upper two leaf-sheaths are approximate and leaf-blades are almost totally wanting ; the spikelets are more robust and larger than in *A. fastigiata*.

20. **A. hirtigluma** Steud. ex Trin. et Rupr. Spec. Gram. Stip. 171 (1842); Steud. Nomencl. Bot. ed. 2. 131 (1841) nomen tantum; Hack. in Bull. Herb. Boiss. 4. Append. III. 18 (1896); Henrard Monogr. 1. 68 cum ic. tab. 15 (1929).

Atharratherum ciliatum Nees, Fl. Afr. Austr. 182 (1841) excl. syn.

Delicate annual, caespitose. *Culms* up to 40 cm. long, 2-4-noded, glabrous; internodes terete and striate, usually scaberulous; nodes glabrous. *Leaf-sheaths* shorter than the internodes, striate, scabrous, somewhat compressed; *ligule* shortly ciliate; auricles long-bearded; collar glabrous; blades 6-15 cm. long, setaceous, convolute, scaberulous on the lower surface, upper surface somewhat hairy, especially towards the ligule. *Spikelets* pale, hirtellous. *Glumes* unequal to subequal; the lower up to 6 mm. long, ciliate dorsally; the upper up to 10 mm. long, dorsally ciliate. *Lemma* including the callus up to 4 mm. long or slightly longer, tuberculate; *callus* long and sharp, somewhat oblique; column of awns up to 10 mm. long, hairy or glabrous; central awn very long (up to 5-7 cm.), feathery with a naked excurrent tip; lateral awns about 1-1.5 cm. long.

TYPE SPECIMEN.

Galpin et Pearson 7402 is deposited in the Herbarium, Royal Bot. Gardens, Kew.

The facies of this variety is identical with that of the species but may be distinguished by the penicillate branching point of the awn (as in *A. uniplumis* Licht.) and the naked column.

21b. *A. gracilior Pilger* var. *Pearsonii Henrard* Crit. Rev. 3. 695 (1938); Henrard Monogr. 1. 69 (1929).

ANGOLA.

Between Mossamedes and R. Coroca, IV. 1909, *Pearson* 2249 (K, N); about 100 km. from Mossamedes, IV. 1909, *Pearson* 2395 (K); Cautas on Mossamedes Railway, IV. 1909, *Pearson* 2361 (K).

SOUTH WEST AFRICA.

TYPE SPECIMEN.

Pearson 2249 is deposited in The Herbarium, Royal Bot. Gardens, Kew.

The facies of this variety resembles that of the species but may be recognised by the naked column and the absence of a pencil of hairs at the branching-point of the awns.

Bemerk. 121 (1844). *Stipagrostis capensis* Nees in Linnaea 7. 291 (1832) ; Kunth Enum. 1. 197 (1833) ; Nees, Fl. Afr. Austr. 171 (1841). *Stipagrostis obtusa* Nees in Linnaea 7. 293 (1832) ; Kunth Enum. 1. 198 (1833).

Perennial, compactly caespitose. Innovations numerous. *Culms* from a few centimetres up to 50 cm. high, very slender, 1-noded, glabrous, smooth, erect or geniculate at the nodes ; internodes exserted. Lower *leaf-sheaths* short, firm and persistent, glabrous or woolly near the margin, with more or less reduced blades ; the upper much shorter than the internode, tight, striate, often somewhat compressed, with hyaline margins, sometimes lightly villous ; *ligule* a short ciliolate rim ; auricles densely and often very long-bearded ; collar smooth ; blades very variable with regard to length, 1.5-20 cm. long, setaceous, convolute, rigid or subrigid, curved or flexuous, glaucous, striate, glabrous or lightly villous or scaberulous beneath, minutely villous or hirtellous on the upper surface, scarcely 0.5 mm. wide when expanded, terminating in a callus-like obtuse tip. *Panicle* very narrow, erect, contracted, but rather loose and interrupted at the base, 2.5-20 cm. long ; axis terete or striate, glabrous or scaberulous upwards ; branches solitary, bipartite nearly from the base, filiform, erect or somewhat spreading ; branchlets scaberulous, axils glabrous ; lateral pedicels short, always shorter than the glumes. *Spikelets* yellow, often flushed with purple at the base. *Glumes* sub-equal, scaberulous dorsally with numerous rows of fine protuberances ; the lower lanceolate, obtuse, 3-nerved, scabrous on the keel, usually exceeding the upper glume in length, 8.5-12 mm. long ; the upper narrowly-lanceolate, subacute, 1-3-nerved, smooth on the keel, 8-11 mm. long. *Lemma* oblong, about 3 mm. long including the callus, smooth ; *callus* nearly 1 mm. long, acute, densely hairy ; column of awns variable in length, 4-10 mm. long, straight or twisted ; central awn scaberulous in lower half, densely plumose in upper part up to the very tip, about 2-3.2 cm. long ; lateral awns naked, very fine, divaricate, 0.75-1.75 cm. long. *Pale* nerveless, broad, ± 1 mm. long. *Anthers* 4-5 mm. long.

TYPE SPECIMEN.

The type is deposited in the Institut de Botanique, University of Montpellier, France.

COMMON NAMES.

Beesgras. Bushman Grass. Fyne Twaagras. Gemsbokgras. Klein Twaagras. Klip Toagras. Small Bushman grass. Toagras(s). Twaagras.

ECONOMIC NOTES.

Many collectors report that this species is a good fodder for all kinds of stock and in some parts of South West Africa is one of the most important pasture grasses. It is very tough and lasts well (persists).

23. ***A. brevifolia* (Nees) Steud.** Nomencl. Bot. ed. 2. 130 (1842); Trin et Rupr. Spec. Gram; Stip. 170 (1842); Walp. Ann. Bot. **3**. 749 (1852); Steud. Syn. Pl. A. geminifolia Trin. et Rupr. sec. F. Bolus in Ann. S. Afr. Mus. **9**. IV. 234 (1915) pro parte, non Trin. et Rupr. *A. obtusa* Del. sec. F. Bolus in Ann. S. Afr. Mus. **9**. IV. 233 (1915) pro parte, non Del. *Arthratherum brevifolium* Nees, Fl. Afr. Austr. 183 (1841).

Perennial, suffrutescent, with a much-branched woody rootstock. Culms up to 100 cm. high, but usually much shorter, many-noded, erect or ascending, terete, striate, slender, minutely puberulous and covered with many glands; lower internodes short, more or less aggregated, the upper gradually longer and exserted; nodes with an evanescent flake of wool. Leaf-sheaths tight; the lower longer or slightly shorter than the internodes, terete, striate, gland-dotted, covered with evanescent wool at the mouth and along the margins, those of the short cylindric innovations very broad and with rudimentary spiny blades; the upper sheaths much longer, shorter than the internodes, glandular or becoming more or less glabrescent; ligule a short ciliate rim; auricles bearded with a flake of wool; collar a more or less pubescent villous line, eventually becoming glabrous; blades densely striate, convolute or flat, subpungent, subrigid to very rigid, spreading, glaucous, asperulous beneath, glandular hispidulous or pubescent on the upper surface, up to 12 cm. long but usually much shorter, up to 3 mm. broad. Inflorescence exserted; peduncle terete, striate, puberulous and glandular. Panicle contracted, linear, somewhat spike-like but loose and interrupted at the base, up to 20 cm. long including the awns but usually much shorter; rachis striate, angular, glabrous, here and there dotted with glands; branches short, divided from the base, usually few-flowered, smooth; pedicels shorter or longer than the glumes. Spikelets green or yellowish, often tinged with purple. Glumes lanceolate, acuminate, minutely truncate, glabrous or puberulous or ciliate near the margins and glandular, unequal; the lower 8-11 (15) mm. long; the upper 11.5-15 (17) mm. long, 3-5-nerved. Lemma linear-oblong, smooth, with an obtusely slightly bilobed tip, including the callus 5.5-7 mm. long; callus very acute, pungent, up to 2-2.5 mm. long, long-hairy; column twisted, 4-9 mm. long; central awn glabrous or scantily plumose at the base, densely plumose above to the very tip, obtuse in outline, 2.3-4.0 cm. long; lateral awns naked, 1.0-1.8 cm. long. Anthers up to 7 mm. long.

SOUTH WEST AFRICA.

TYPE SPECIMEN.

Drège (lectotype!) is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Bosjes-gras. Twa-gras. T'waagras.

ECONOMIC NOTES.

Drège states that "die Körner dieses Grases werden als Grütze von den Hottentotten sehr geschätzt."

REMARKS.

Pearson 4590 appears to be a large-flowered form of this species. The glumes are fairly large (1 = 15 mm., II = 17 mm.) and pubescent towards the margins: the lemma and central awn are longer than in most other specimens seen. In general characters however this gathering agrees well with *A. brevifolia*.

24. **A. uniplumis** *Licht. in Roem. et Schult.*, *Syst. Veg.* **2**. 401 (1817); *Trin. Gram. Unif.* et *Sesquifl.* 180 (1824); *Trin. in Mem. Acad. Imp. Sc. Petersb.* **6**. I. 89 (1829); *Kunth. II. 227 (1937). *A. uniplumis* *Licht. var. Neesii* *Walp.* sec. *Garabedian* in *Ann. S. Afr. Mus.* **16**. II. 406 (1925), non *Walp. Arthratherum uniplume* *Nees*, *Fl. Afr. Austr.* 181 (1841).

Perennial, densely caespitose. *Culms* including the inflorescence up to 75 cm. high or more, erect, 3-4-noded, simple or branched upwards; internodes striate and terete,

smooth or scaberulous; nodes glabrous. *Leaf-sheaths* reduced to leafless scales, or the upper tight, terete, striate, smooth or scaberulous upwards, shorter than the internodes; ligule a ciliate rim; auricles densely bearded; collar glabrous; *blades* setaceous, convolute, curved or flexuous, up to 10 cm. long, glabrous and striate on the lower surface, scaberulous on the upper surface with usually a few long hairs towards the ligule. *Panicle* long-exserted, fairly compact to diffuse; axis terete in lower part, angular and scaberulous upwards; branches spreading or suberect, usually solitary but branched near the base, almost smooth; pedicels capillary, often sinuate, scaberulous, much thickened upwards. *Spikelets* pale yellow to purplish or purplish-brown. *Glumes* glabrous or with scattered marginal hairs, almost papery, unequal; the lower 8-9 mm. long; the upper 9-11 mm. long. *Lemma* cylindric, including the callus about 4 mm. long, smooth, slightly tuberculate upwards; *callus* about 1 mm. long, acute, densely bearded; column of awns about 5 mm. long, densely penicillate at the apex, otherwise glabrous; central awn up to 2.5 cm. long, naked in its lower part, densely plumose upwards; lateral awns up to 12 mm. long, very fine.

SOUTH WEST AFRICA.

TYPE SPECIMEN.

Lichtenstein 50 (60 ?) is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Blankaar. Bushman grass. Buschmanngras. Langbeen Twaai. Large Bushman grass. Silwergras. Soetgras. T'waagras.

ECONOMIC NOTES.

This species constitutes one of the main fodder-grasses of the Namib where it remains green only for a very short period ; it is also eaten in the dried state by stock and game. In the Griqualand West area it is also considered an excellent fodder and as it does not produce stools, it may be cut and stored as hay or silage. In the pre-flowering and flowering stage this grass is sweet, but gradually becomes less so after frost and winter rain. In the wilted condition this species has been found to contain prussic acid.

- 24a. **A. uniplumis** *Licht.* var. **Neesii** *Trin. et Rupr.* Gram. Stip. 173 (1842) ; *Walp.* Ann. Bot. **3**. 750 (1852) ; *Dur. et Schinz*, Conspl. **5**. 809 (1894) ; *Dinter* in *Fedde*, Rep. **15**. 343 (1918) ; *Henrard* Crit. Rev. **3**. 646 (1928) ; *Henrard* Monogr. **1**. 77 (1929).
A. uniplumis *Licht.* sec. *Stapf* in *Dyer*, Fl. Cap. **7**. 569 (1899) pro parte ; *Stent* in *Bothalia* **1**. IV. 278 (1924), non *Licht.*

The facies of this variety greatly resembles that of the species. The glumes however are longer and the lemma is somewhat larger than in the species. Furthermore the central awn is fairly robust, usually dark in colour and plumose to the base, the column however is glabrous.

CAPE PROVINCE.

ORANGE FREE STATE.

Without precise locality, *Buchanan* 69 (D, K, S).

TYPE SPECIMEN.

Pearson 2487 is deposited in The Herbarium, Royal Botanic Gardens, Kew.

25. **A. gonostachys** Pilger in Engl. Bot. Jahrb. **48**. 343 (1912); Dinter in Fedde, Rep. **15**. 341 (1918); Garabedian in Ann. S. Afr. Mus. **16**. II. 402 (1925); Henrard Crit. Rev. **1**. 205 (1926); Henrard Monogr. **1**. 81 cum ic. tab. 20 (1929); Range in Fedde, Rep. **33**. 8 (1933); Theron in Fedde, Rep. **40**. 30 (1936) [sphalm. *gonostachys*].

Perennial, densely caespitose, tufts 2–3·5 cm. high. *Culms* up to 10 cm. long, exserted beyond the small tussocks, somewhat geniculate, 1-noded; lower internode exserted, 5–6 cm. long, slender, terete, thickened upwards towards the node; upper node hairy. Lower *leaf-sheaths* reduced to yellowish broad scales, sulcate-striate, glabrous or scantily woolly along the margins, the upper sheath partly embracing the inflorescence, scaberulous and leafless; *ligule* a ciliate rim; auricles densely long-bearded; blades up to 2 cm. long, involute, obtuse, striate and sulcate, scaberulous on the lower surface, with fairly long hairs arising dorsally between the longitudinal ridges, upper surface hirtellous, curved, glaucous. Peduncle very short. *Panicle* almost sessile, sheathed by the uppermost sheath, 3–4 cm. long, spike-like; axis striate and pubescent; lower branches binate, the upper solitary. Pedicels clavate and hairy near the apex. *Spikelets* pallid, somewhat secund. *Glumes* subequal, 7–9 mm. long, lanceolate, acuminate, the lower distinctly scaberulous. *Lemma* including the callus about 4 mm. long; *callus* 1 mm. or somewhat longer, acute, shortly bearded, but long-bearded at the base of the lemma; column of awns up to 4 mm. long; central awn about 1 cm. long, glabrous at the base, densely plumose in its upper part up to the tip; lateral awns about 7 mm. long.

SOUTH WEST AFRICA.

Rotekuppe, I. 1907, *Range* 188 (B); do., I. 1910, *Dinter* 1022 (B); Guos, Küstenwüste, IX. 1911, *Range* 1177 (B, N).

TYPE SPECIMEN.

The Syn-types are deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAME.

Kleines Buschmanngras.

26. **A. lanipes** Mez in Fedde, Rep. **17**. 153 (1921); Garabedian in Ann. S. Afr. Mus. **16**. II. 403 (1925); Henrard Crit. Rev. **2**. 285 (1927); Henrard Monogr. **1**. 81 (1929); Theron in Fedde, Rep. **40**. 30 (1936).

Perennial, densely caespitose, dwarf, including inflorescence up to 10 cm. high. Lower *leaf-sheaths* pallid, striate, dorsally glabrous but densely woolly lanate towards and on the margins with white hairs, margins of leaf-sheaths upwards hyaline, upper leaf-sheaths densely woolly all over the dorsal surface, only the stout midrib clearly visible; *ligule* a fringe of woolly hairs; *blades* about 0·5–1·0 cm. long, somewhat recurved, linear, obtuse, glabrous and striate, glaucous, apparently terete but the margins conduplicate and somewhat involute. Culm 1-noded (the lowermost node sheathed but not exserted.) Axis terete, glabrous somewhat thickened towards the node. *Sheath* arising at the upper node in the axil of which the inflorescence appears to arise, narrowly lanceolate, glaucous, glabrous, striate, with a much-reduced blade. *Inflorescence* ± 4-flowered, a lax sub-simple panicle, with the branchlets at the base of the inflorescence bearing 1–2 spikelets. Rhachis sub-compressed, striate, flexuous, minutely scaberulous. Pedicels likewise, somewhat thickened towards the apex. *Glumes* subequal, three-nerved; the lower slightly shorter than the upper, about 9–9·5 mm. long, with minutely scaberulous lines on the outer surface not

unlike those found in *A. obtusa* Del.; the upper smooth and glabrous, margins hyaline. *Lemma* ± 6 mm. long including the callus; *callus* acute, densely hairy, about 2 mm. long; column of awn 2·0 mm. long, twisted, glabrous. Central awn plumose towards the apex, naked and glabrous below and at the point of insertion of the lateral filiform glabrous 9 mm. long awns. *Anthers* 3 mm. long.

SOUTH WEST AFRICA.

Near Lüderitzbucht, west of Kuibis, *Range* 1822 (B).

TYPE SPECIMEN.

Range 1822 (*unicum*?) is deposited in the Botanisches Museum, Berlin-Dahlem.

This species is very closely related to *A. gonatostachys* Pilger and differs from it in several minor points. The facies of the two species concerned is very similar. A wider range of material of these two species may prove them to be conspecific.

27. ***A. Dregeana* (Nees) Trin. et Rupr.** Spec. Gram. Stip. 169 (1842); Walp. Ann. Bot. 3. 749 (1852); Steud. Syn. Pl. Glum. 1. 144 (1854); Dur. et Schinz, Consp. 5. 802 (1894); Stapf in Dyer, Fl. Cap. 7. 569 (1899) excl. syn. pro parte; Dinter in Fedde, Rep. 15. 341 (1918); Garabedian in Ann. S. Afr. Mus. 16. II. 401 (1925) pro parte; Henrard Crit. Rev. 1. 154 (1926); Henrard Monogr. 1. 83 cum ic. tab. 22 (1929); Range in Fedde, Rep. 33. 8 (1933); Theron in Fedde, Rep. 40. 20 (1936).

A. obtusa Del. sec. Hack. in Bull. Herb. Boiss. 4. Append. III. 19 (1896) non Del.; Garabedian in Ann. S. Afr. Mus. 16. II. 403 (1925) pro parte, non Del. *Stipagrostis Dregeana* Nees, Fl. Afr. Austr. 172 (1841); Presl, Bot. Bemerk. 121 (1844).

Perennial, densely caespitose, much-branched at the base. *Culms* slender, erect or geniculately ascending, simple, 1–3-noded, the lowermost node basal or almost so, up to 25 cm. high including the awns; internodes terete or somewhat compressed, smooth and glabrous, usually exserted; nodes glabrous. *Leaf-sheaths* very tight, distinctly striate, slightly scaberulous, shorter than the internodes; the lower broad, pallid, firm and persistent, much-reduced and scale-like, bearing very short blades; *ligule* a short ciliolate rim; auricles pubescent; collar glabrous; blades setaceous, convolute, subacute, up to 12·5 cm. long, fairly rigid, glabrous and smooth beneath, more or less hirtellous or pubescent on the upper surface. *Panicle* erect, or somewhat nodding at the summit, lax and loose, up to 12 cm. long including the awns; rhachis smooth, grooved; branches usually binate, smooth; branchlets 1–2-flowered; the branches, branchlets and pedicels rather capillary and often flexuous. *Spikelets* yellowish and purple. *Glumes* linear-lanceolate, subacute, subequal, 3-nerved; the lower 11–13 mm. long, acuminate, purple towards the base, minutely scaberulous on the keel towards the apex, towards the apex often a few scattered minute hairs, in the young state dorsally often somewhat shortly hairy, hairs deciduous; the upper 11–13 mm. long, obtuse, emarginate or distinctly bifid, mucronate from the sinus, minutely scaberulous towards the apex, otherwise glabrous, purple towards the base. *Lemma* oblong-cylindric, glabrous, purplish, including the callus about 4 mm. long; *callus* acute, densely hairy, 1–1·5 mm. long; column of awns about 4 mm. long, twisted, glabrous; central awn 3–4 cm. long, feathery above the middle to the very tip, plumose region obtuse in outline; lateral awns naked or very nearly so, up to 17 mm. long. *Anthers* 5·5–6 mm. long.

SOUTH WEST AFRICA.

A. dregeana Trin. et Rupr. sec. F. Bolus in Ann. S. Afr. Mus. **9**. IV. 234 (1915) pro parte, non Trin. et Rupr.

Perennial, laxly caespitose, from a much-branched almost woody rootstock. Innovations erect or irregularly ascending, intra- or extravaginal. *Culms* erect or somewhat ascending, rather thin and elegant if compared with the robustly-branched rootsystem, terete, smooth, 2-3-noded; internodes terete, glabrous, exserted; nodes glabrous. Lower *leaf-sheaths* reduced to pale striate glabrous scales, bearing much-reduced leaf-blades; the upper tight, shorter than the internodes, glabrous and terete below, striate upwards; *ligule* a minute ciliate rim; auricles minutely pubescent or glabrous; collar glabrous; *blades* very narrow, linear, convolute, setaceous, acute and subpungent, rather rigid and curved (almost wiry), up to 12 cm. long, glabrous and striate beneath, hirtellous on the upper surface, glaucous, gradually tapering to a point. *Panicle* shortly exserted, up to 20 cm. long including the awns, somewhat depauperate, very lax and open; rhachis terete and smooth below, rather angular and scaberulous upwards; axis glabrous; lower branches solitary or 2-3-nate from the base, the upper solitary, all few-flowered and scaberulous; pedicels minutely scaberulous, subclavate, as long as or shorter than the glumes. *Spikelets* erect, pallid but purplish towards their base. *Glumes* lanceolate, glabrous; the lower up to 12 mm. long, shortly bidentate at the subobtuse apex; the upper subacute, 12.5-15 mm. long. *Lemma* smooth, including the callus about 5.5 mm. long; *callus* 1.5 mm. long, hairy, acute; column of awns 8-10 mm. long, twisted; central awn up to 40 mm. long, naked in the lower third or plumose almost to the base, plumose to the very tip, slender and acute in outline; lateral awns naked, very thin, up to 15 mm. long.

SOUTH WEST AFRICA.

Kunguibgebirge, X. 1912, *Range* 1069 (B); 18 km. west of Aus, II. 1909, Pearson 4213 (BH, K); Garub, X. 1907, *Range* 508 (B, BM, K, N); do., X. 1907, *Range* 536 (B).

TYPE SPECIMEN.

Range 508 and 536 are deposited in the Botanisches Museum, Berlin-Dahlem.

29. **A. sericans** Hack. apud Schinz in Bull. Herb. Boiss. **3**. 381 (1895); Stapf in Dyer, Fl. Cap. **7**. 563 (1899); Hennard Crit. Rev. **3**. 554 (1928); Hennard Monogr. **2**. 158 cum ic. tab. 61 (1932); Theron in Fedde, Rep. **40**. 17 (1936).

Perennial, densely caespitose. *Culms* simple, erect, terete, up to 75 cm. high, very slender, 1-noded. *Leaf-sheaths* very tight, striate, glabrous or hairy all over except in the region just above the nodes, shorter than or exceeding the internodes; *ligule* ciliate; auricles bearded; *blades* finely filiform, setaceous, strictly erect, convolute, acute, up to 30 cm. long or even almost as long as the culms, glaucous, glabrous or hairy below, glabrous or hispidulous above, 0.5-1.0 mm. wide, strongly nerved. *Panicle* erect, dense, up to 20 cm. long, the base of the panicle sheathed by a submembranous thinly villous light-brown bract, the upper branches sparingly branched; branchlets and pedicels hairy or glabrous, the latter much shorter than the glumes. *Glumes* subequal, villous, linear-lanceolate,

acuminate, 3-nerved, with sparingly hairy or hyaline tips; the lower 10–15 mm. long; the upper 12–16·5 mm. long. *Lemna* purple, smooth, slightly scaberulous towards the apex, linear-lanceolate, including the callus up to 7 mm. long, produced without an articulation into the column; *callus* about 1–1·5 mm. long, acute, densely hairy; column 2–3·5 mm. long, twisted, hairy; central awn divergent or spreading, up to 24 mm. long, densely but shortly plumose except for the scabrid apex; lateral awns resembling the central, but only up to 18 mm. long. *Pale* 2·5 mm. long, obtuse, nerveless. *Anthers* about 5 mm. long. *Stigmas* pale yellow, up to 2·5 mm. long. *Caryopsis* linear, 4 mm. long, 0·3 mm. wide, pale brown.

TRANSVAAL PROVINCE.

Standerton distr.: Standerton, *Rehmann* 6793 (B, BH, BM, K, V, Z). Vereeniging distr.: Leeuwkuil Pasture Research Station, III. 1937, *Bunting* 137 (K, N, WR); do., IX. 1937, *R. Story* in NH. 24574 (B, BM, K, N, V, W, Z); do., III. 1939, *R. Foster* in NH. 24575 (B, BM, K, N, V, W, Z).

TYPE SPECIMEN.

Rehmann 6793 is deposited in the Naturhistorisches Museum, Vienna.

REMARKS.

A very rare species apparently with a limited geographic distribution. Until the very welcome recent rediscovery of this plant by Mr. R. Story (*Bunting* 137) the author of the present paper believed this plant to have been of hybrid origin. *Rehmann* 4046 from Pretoria cited by Stapf in Dyer, Fl. Cap. 7. 563 (1899) under this species very probably does not belong here. I do not remember seeing this number and possibly the locality indicated on the sheet is incorrect, as *A. sericans* is so far only known to occur in the true Highveld area of the Transvaal.

The species bears a strong resemblance to *A. capensis* Thunb. var. *Dieterleniana* mihi with which it may readily be confused. Dissection of the spikelets however immediately reveals that the species in question belong to different sections of the genus.

30. ***A. Sciurus* Stapf** in Dyer, Fl. Cap. 7. 557 (1899); Stent in Bothalia 1. IV. 277 (1924); Henrard Crit. Rev. 3. 548 (1928); Henrard Monogr. 2. 164 cum ic. tab. 65 (1932).

Robust erect *perennial*, up to 140 cm. high. *Culms* arising from a short rhizome, about 4–5-noded, simple; internodes included or exserted, up to 25 cm. long but often much shorter, almost glabrous to densely adpressedly woolly just below the nodes, terete, smooth or somewhat striate towards the nodes; nodes glabrous, not very conspicuous. *Leaf-sheaths* crowded near the base, striate, glabrous or more or less fugaciously woolly, tight; *ligule* a line of very short hairs obscured by the dense aggregation of wool at the mouth of the leaf-sheath, more rarely the mouth of older leaf-sheaths almost glabrous; *blades* linear, acute, setaceous convolute, up to 60 cm. long or even longer, smooth on the lower surface, markedly striate and finely asperulous on the upper surface, about 5 mm. wide or less at the base. *Panicle* dense, contracted, at times almost spike-like, up to 45 cm. long but often shorter, erect; rhachis stout, smooth; branches fascicled, the lowest up to 20 cm. long, remotely and repeatedly branched; branchlets filiform to capillary, scaberulous. *Spikelets* pallid or tinged with purple, glabrous. *Glumes* 1-nerved, very unequal, fairly thin; the lower lanceolate oblong, acute, 5–7 mm. long, minutely scaberulous towards the apex; keel prominent and minutely scabrous; the upper linear-oblong, 11–13 mm. long, shortly mucronate from a bifid apex. *Lemna* linear, up to 12 mm. long, smooth, obscurely beaked; *callus* 1–1·5 mm. long, rounded and obtuse, densely hairy; awns subequal, the central up to 23 mm. long, the lateral up to 20 mm. long. *Pale* 1·5 mm. long. *Lodicules* few-nerved, about 1·5 mm. long. *Anthers* 6 mm. long, anther-cells minutely apiculate.

NATAL PROVINCE.

Esteourt distr.: Colenso, III. 1894, *Kuntze* s.n. (K, N); without precise locality, *Gerrard* 471 (BM, K, N) and *Gerrard et McKen* 161 (D, N).

TRANSVAAL PROVINCE.

Carolina distr.: Waterval Boven, II. 1904, *Burtt Davy* 1449 (N); Badplaats, II. 1926, *Pole Evans* 1967 (N); between Machadodorp and Carolina, II. 1908, *Mundy* H. 4292a (N). Lydenburg distr.: Machadodorp, III. 1934, *Pole Evans* 3688 (N). Waterberg distr.: Zebediel's Kraal, *Nelson* 26 (K, N).

TYPE SPECIMEN.

Nelson 26 is deposited in The Herbarium, Royal Botanic Gardens, Kew.

REMARKS.

The amount of wool (pubescence) on the internodes is variable. Some specimens (*Burtt Davy* 1449) have almost glabrous internodes. The elongated obtuse callus and the absence of an articulation in the lemma however, provide a good means of distinguishing the species.

COMMON NAMES.

Krulgras. Steekgras.

ECONOMIC NOTES.

This species is readily eaten by stock.

32. **A. scabrilivalvis** Hack. in Bull. Herb. Boiss. Ser. 2. **6**. 708 (1906); Dinter in Fedde, Rep. **15**. 343 (1918); Stent in Bothalia **1**. IV. 277 (1924); Henrand Crit. Rev. **3**. 534 (1928); Henrand Monogr. **2**. 202 cum ic. tab. 91 (1932).

Annual, slender, erect or somewhat ascending, including the inflorescence up to 85 cm. high, often very much smaller, usually branched from or very near the base. *Culms* elegant, slender, branched from nearly all nodes, about 3-4-noded; nodes usually conspicuous, glabrous; internodes glabrous, up to 12 cm. long, exserted, more or less terete. *Leaf-sheaths* lax, the lower slipping from the culms, keeled, striate, minutely scaberulous or glabrous; *ligules* densely and shortly ciliolate; auricles densely ciliolate or glabrous; collar glabrous; *blades* linear, gradually narrowed, up to 30 cm. long and 3·5 mm. wide, often much shorter and narrower, rigid or somewhat flaccid, glabrous beneath, scaberulous and hirtellous on the upper surface, margins scabrous and thickened. *Panicles* terminal and lateral, lax and open, up to 30 cm. or more long, often very much shorter and smaller, ovate in outline. *Axis* smooth or very minutely scaberulous; branches filiform, straight or somewhat flexuous, scaberulous, solitary or binate, elongate, the lower sometimes more than half as long as the panicle, naked in their lower part, the spikelets more or less scattered or at times congested towards the ends of the branches; pedicels scaberulous, longer to

shorter than the glumes. *Spikelets* usually purple or purplish-brown in colour. *Glumes* linear-lanceolate, acute, prominently awned, slightly unequal to unequal, scaberulous, with a very markedly scabrous keel; the lower up to 9 mm. long, including the awn but often much shorter, awn 2·5 mm. long arising from the slightly bifid apex of the glume; the upper also up to 9 mm. long including the 1·5 mm. long awn, lateral setae well-developed. *Lemma* linear, tubular or somewhat compressed and keeled, about 7-8 mm. long, often much shorter, usually aculeolate-scabrous except near the base but always markedly scabrous on the keel, purplish to greenish in colour and usually mottled, somewhat narrowed towards the apex; *callus* ± 0·5 mm., rounded, densely bearded; awns up to 14 mm. long, scabrous, erect or spreading, the lateral slightly shorter than the central.

TYPE SPECIMEN.

Cronje 7643 is deposited in The Herbarium, Royal Bot. Gardens, Kew.

COMMON NAMES.

Steekgras(s).

ECONOMIC NOTES.

This species is very wiry and thus unpalatable.

35. **A. monticola** Henrard Crit. Rev. **2**. 355 (1927) ; Henrard Monogr. **2**. 220 cum ic. tab. 101 (1932).

Perennial, usually caespitose, but sometimes assuming an almost creeping habit, rooting at the lowermost nodes. *Culms* erect or geniculately ascending, including the panicle up to 80 cm. high, many-noded, usually giving rise to branches at the nodes ; internodes elegant, terete, wiry, scarcely 1 mm. thick, glabrous, striate, exserted. *Leaf-sheaths* short or about one half the length of the internodes, terete, tight, glabrous and striate. *Ligule* a thickened shortly ciliolate rim ; auricles long-bearded ; collar glabrous ; *blades* narrow linear, flat or convolute at the base, glaucous, up to 12 cm. long and 2 mm. wide, glabrous on the lower surface, upper surface scaberulous and at times with some scattered long hairs, margins markedly thickened, acute, curved or flexuous. *Panicle* erect, lanceolate in outline, up to 14 cm. long ; rhachis scaberulous and striate ; branches usually binate, scaberulous, striate, ascending or almost adpressed ; pedicels longer or shorter than the glumes. *Spikelets* erect, dull purplish-brown. *Glumes* linear-lanceolate, 1-nerved ; the lower 6-8.5 mm. long, shortly awned, glabrous except for the scabrous keel ; the upper glabrous, 5-6 mm. long, bidentate at the apex with a very short mucro from the sinus. *Lemma* tubulous, purple, smooth, 6-6.5 mm. long, produced into a distinctly twisted short scabrous column ; *callus* very short, rounded, obtuse, long-bearded ; awns unequal, sub-erect or divergent, the central up to 18 mm. long, the lateral branches up to 13 mm. long.

NATAL PROVINCE.

Ipolela distr. : Underberg, III. 1938, *McClean* 683 (N). Bergville distr. : Mt. Aux Sources, IV. 1919, *Mogg* 5282 (N) et H. 20634 (K, N) ; do., II. 1926, *Bayer et McClean* 154 (K, N) et 157 (K, N). Champagne Castle, X. 1933, *Meebold* NH. 15728 (N).

TYPE SPECIMEN.

Mogg H. 20634 is deposited in The Herbarium, Royal Botanic Gardens, Kew.

ECONOMIC NOTES.

This species has a very restricted geographic distribution. It has so far only been recorded from the Drakensberg area in Natal. The plants often form a dense tangle along the banks of streams and are also commonly met with in the more open parts of the bush along the mountain gulleys.

BECHUANALAND PROTECTORATE.

Kanye, III. 1937, *Bunting* 132 (N).

TYPE SPECIMEN.

Drège (Port Natal ?) is deposited in the Trinius Herbarium, Leningrad.

COMMON NAMES.

Heigras. Koperdraat. Wire-grass.

ECONOMIC NOTES.

This species is tough and wiry and thus from a forage point of view, useless.

REMARKS.

The spikelets of this species show a great deal of variation. One and the same specimen (*Flanagan* 2218) shows the following ranges : Lower glume 7–9 mm., upper glume 8–12 mm., lemma 6–9 mm., central awn 12–34 mm., and lateral awns 9–28 mm. long. The length of the column likewise is extremely variable. *Galpin* 6901 shows the presence of spikelets in which the column is well-developed and exserted beyond the glumes, whereas in others of the same gathering the column is only weakly developed and thus not exserted beyond the glumes.

From the foregoing synonymy it is evident that I do not consider *A. angustata* Stapf to be specifically distinct from *A. junciformis*. The reason is that *Wolley-Dod* 2387 and *Rehmann* 2582, syn-lectotypes of Henrard, have culms which are distinctly compressed below the nodes, furthermore the lemmas are not always exserted beyond the shortly mucronate glumes. The most important characters of distinction thus break down.

Examination of Rendle's types of *A. Welwitschii* in the British Museum have also revealed the presence of culms which are compressed below the nodes. This also holds good for the var. *minor* of Rendle. These specimens are not distinguishable from *A. junciformis* on the character just mentioned.

Since Henrard considers *A. Welwitschii* to be synonymous with *A. angustata* and on which point I fully agree, I have not been able to arrive at a view other than that expressed in the synonymy cited above for this species.

37. *A. transvaalensis* Henrard Crit. Rev. Suppl. 742 (1933) ; Henrard Monogr. 2. 235 cum ic. tab. 111 (1932).

Densely caespitose perennial. Culms erect, simple below, branched from most of the nodes, more rarely simple, erect, elegant, few to many-noded, including the panicles up to 70 cm. high ; internodes glaucous, striate, terete, smooth or very minutely scaberulous, exserted from the leaf sheaths, lowermost internode usually long (up to 30 cm. !) ; nodes inconspicuous, glabrous. Basal leaves pallid, slipping from the stems ; lower sheaths striate, somewhat compressed or subterete, glabrous, with somewhat hyaline margins ; the upper sheaths lax and slipping from the internodes or fairly tight and not slipping from the internodes ; ligule minute and shortly ciliolate ; auricles minutely bearded ; collar glabrous ; the basal blades soon dying off, linear, acute, recurved or flexuous, striate, lower surface glabrous, scabrous on the upper surface, convolute ; the upper narrow convolute about 1 mm. wide (when opened out), setaceous, acute, flexuous or somewhat curved,

up to 15 cm. long, striate, glabrous beneath, scaberulous and with prominently thickened marginal veins above, margins minutely serrate. *Panicle* narrow, somewhat lax, up to 8 cm. long, scarcely or well-exserted; axis more or less terete or subangular, scaberulous or smooth; branches solitary, bipartite from the base, up to 2·5 cm. long, erect and adpressed, bearing spikelets to the base or shortly peduncled and with erect branchlets; pedicels scabrous. *Spikelets* congested, shortly pedicelled, pallid or dull-purplish or greenish, small, erect. *Glumes* lanceolate, unequal, 1-nerved, acute; the lower 5–9 mm. long, shortly awned, upwards scabrous on the keel; the upper 6·5–10 mm. long, minutely subtruncate at the apex and awned, glabrous on the keel. *Lemma* smooth, minutely granular upwards, tubulous, together with the column up to 11·5 mm. long, narrowed above and stipitate or with a well-developed column; *callus* very short (0·3 mm.), very obtuse, almost truncate, densely hairy; column 1–5·5 mm. long, scabrous, twisted; awns unequal, scabrous; the central divergent (almost geniculately so) and 6–13 mm. long; the lateral at times absent, more usually present and up to 8 mm. long.

Barberton distr.: Barberton, V. 1930, *Thorncroft* 21 (B, K, N).

BECHUANALAND PROTECTORATE.

Kanye, III. 1937, *Bunting* 132 (N).

TYPE SPECIMEN.

Moss 14259 is deposited in The Herbarium, Royal Botanic Gardens, Kew.

ECONOMIC NOTES.

Owing to the wiry nature of the culms and the scantiness of leaf, this species most probably is unpalatable.

REMARKS.

In this species the lateral awns are not always well-developed. *Thorncroft* 21 has several inflorescences in which they are absent or merely weakly developed, so that the spikelets superficially resemble those of *Stipa parvula* Nees. The same gathering also shows inflorescences with lemmas in which the lateral awns are well-developed, thus proving that the length of the lateral awns is extremely variable. The length of the column of the awns is likewise extremely variable even in one and the same individual.

This species grows in close proximity to *A. aequiglumis* Hack. but may be distinguished from this by the comparatively more-contracted inflorescence and smaller spikelets. The branching of the culms is not a critical character since it also occurs in *A. aequiglumis* though far less frequently so. *A. transvaalensis* is very commonly met with on the northern slopes of the Magaliesberg where it grows in the crevices on quartzite and forms dense tussocks.

38. *A. aequiglumis* Hack. in Bull. Herb. Boiss. **3**. 381 (1895); Stapf in Dyer, Fl. Cap. **7**. 555 (1899); Henrard Crit. Rev. **1**. 18 (1926); Henrard Monogr. **2**. 236 cum ic. tab. 112 (1932); Theron in Fedde, Rep. **40**. 21 (1936).

Perennial, densely caespitose, up to 70 cm. high, but usually much smaller. *Culms* slender, simple, erect, terete, 3-4-noded, rarely branched from the nodes; internodes glabrous, striate, exserted. *Leaf-sheaths* persistent, shorter than the internodes, striate glabrous, the lower pallid; *ligule* a minutely ciliolate rim; *auricles* minutely pubescent, more rarely bearded with a few long white hairs; *blades* setaceous, convolute, rather firm, recurved or flexuous, up to 15 cm. long but often much shorter, finely striate and glabrous on the lower surface, minutely pubescent and striate on the upper surface, margins scabrous. *Panicle* linear-oblong, contracted or lax and open but never spike-like, about 10 cm. long, rarely somewhat longer; *rhachis* filiform; branches remotely 2-3-nate or the upper solitary, erect and almost adpressed to the rhachis, the longest up to 6 cm. long, usually branched from near the middle and bearing 1-3 spikelets on short scaberulous pedicels. *Glumes* linear-lanceolate, 1-nerved; the lower rather broad at the base, 7-11 mm. long, with a prominent and scabrous or glabrous midrib, acute or shortly mucronate from a minutely 2-lobed apex, dorsally minutely scaberulous to conspicuously scabrid-hairy on the flanks, usually somewhat recurved near the apex; the upper 7-11.5 mm. long, midrib conspicuous and glabrous, scaberulous dorsally and often scabrid-hairy on the flanks, shortly mucronate from a minutely 2-lobed apex, often recurved at the apex. *Lemma* linear-convolute, including the callus and twisted scaberulous column from 8-16 mm. long, dorsally minutely scaberulous upwards; column 2-8 mm. long; awns capillary, suberect or slightly spreading, scaberulous; the central 15-30 mm. long; the lateral awns somewhat shorter, 14-28 mm. long. *Anthers* 4 mm. long, pale yellow to purple. *Stigmas* an intense purple, 2.5 mm. long.

TYPE SPECIMEN.

Rehmann 4696 is deposited in the Naturhistorisches Museum, Wien.

REMARKS.

Henrard in his Monogr. **2**. 236 states the lower glume to be "glabrous and smooth, minutely pubescent only at the tip". He uses this as a diagnostic character to distinguish between *A. aequiglumis* and *A. huillensis*. Careful examination of Hackel's type has shown that the lower glume is often scaberulous on both the keel and the flanks and also from the base upwards. A drawing made by Stapf of some of the type gathering in Herb. Kew. also shows the glumes to be scaberulous. In the various sheets enumerated above I have found the lower glume to be scaberulous or even shortly hairy dorsally to a greater or lesser degree. Some spikelets may be almost glabrous and smooth (*Hutton* 883) whereas in the same gathering others again are markedly hairy. It thus appears that the degree

of indumentum of the glumes is of relatively little taxonomic importance. As some specimens of *A. aequiglumis* have branched culms and this is always met with in *A. huillensis*, it is extremely doubtful whether these plants really represent distinct species.

A wide range of material from the type locality and another locality has been collected recently by the author of this paper. These specimens clearly show the range in variation of the species.

39. ***A. rhiniochloa*** Hochst. in Flora **38**. 200 (1855); Dur. et Schinz, Consp. **5**. 808 (1894) [sphalm. *rhiniochloa*]; Dinter in Fedde, Rep. **15**. 342 (1918) [sphalm. *rhiniochloa*]; Henrard Crit. Rev. **3**. 510 (1928); Henrard Monogr. **2**. 242 cum ic. tab. 115 (1932); Range in Fedde, Rep. **33**. 9 (1933).

A. rigidiseta Pilger in Engl. Bot. Jahrb. **51**. 413 (1914); Garabedian in Ann. S. Afr. Mus. **16**. II. 404 (1925); Henrard Crit. Rev. **3**. 516 (1928).

Erect annual, branched from the base and not infrequently from the lower and middle nodes. Culms usually erect, very rarely geniculately ascending, 3 to many-noded; internodes, terete, exceeding the lower leaf-sheaths, retrorsely scabrous, striate; nodes minutely pubescent. Lower leaf-sheaths usually slipping off the stem, compressed, keeled, striate, scabrous, the upper likewise but usually exceeding the internodes; ligule long-ciliate; auricles long-bearded; blades flat, up to 20 cm. long and 4 mm. wide, glaucous, many-nerved, very scabrous on both surfaces, acute but not pungent. Panicle effuse or contracted, up to 30 cm. long; axis very scabrous, striate; branches scabrous, the axils densely shortly hairy, binate, more or less peduncled with 1 or 2 few-flowered short branchlets at the base, upper branches shortly peduncled mostly solitary, bearing clustered spikelets on subsessile pedicels or some of them with well-developed pedicels. Spikelets coarse, pallid or purplish-brown, flushed with purple towards the base of the glumes. Glumes broad, very acute, shortly hairy on the back, 1-nerved, keels somewhat scabrous, awned; the lower broadly lanceolate, acuminate, including the awn up to 17 mm. long, but usually about 13 mm. long; the upper broadly-lanceolate, with two lateral teeth at the apex below the awn, up to 15 mm. long or somewhat shorter. Lemma including the densely hairy subobtuse callus up to 13.5 mm. long, usually somewhat shorter (11 mm.), strongly nerved, the nerves with rows of aculeolate antrorsely curved hyaline sharp hairs, keeled dorsally and deeply grooved ventrally with inrolled margins; awns very scabrous, rigid, triquetrous, almost winged at the base, erect or spreading, subequal or the central somewhat longer, 18–30 mm. long or at times up to 40 mm. long.

BECHUANALAND PROTECTORATE.

Francistown, IV. 1929, Gordon 66 (N).

TYPE SPECIMEN.

The whereabouts of the actual type, Buchinger 1229 leg. Schimper, is not known, although duplicates of the type are deposited in several herbaria (B, P?).

40. *A. andoniensis* Henrard Crit. Rev. **3.** 691 (1928); Henrard Monogr. **2.** 243 (1932).

The habit of this interesting species is not known since it has been described from incomplete material. *Panicle* up to 28 cm. long and 2 cm. wide. *Culms* puberulous and striate below the panicle; *rhachis* puberulous, striate and angular; *branches* binate, erect, naked at the base for 1·5–2 cm., axils minutely pubescent; *pedicels* scabrous, the lateral very short, the terminal up to as long as the glumes. *Spikelets* purple. *Glumes* subequal; the lower 15–16 mm. long, dorsally pubescent, acute, shortly awned; upper glume 14 mm. long, with a 1 mm. long awn from the bifid apex. *Lemma* including the callus up to 12 mm. long, margins inrolled, furrowed ventrally, slightly keeled, glabrous and smooth, minutely scaberulous on the keel; *callus* obtuse, about 1 mm. long; awns erect, triquetrous, winged, very scabrous, up to 30 mm. long.

SOUTH WEST AFRICA.

Andoni, anno 1921, *Barnard* 814 (K, N, S).

TYPE SPECIMEN.

Barnard 814 is deposited in The Herbarium, Royal Botanic Gardens, Kew.

REMARKS.

This species is only known from the above type gathering which consists of rather incomplete material.

41. *A. Hubbardiana* Schweickerdt in Notizbl. Bot. Garten u. Mus. Berlin—Dahlem. **14.** nr. 122. 196 (1938).

A slender annual. *Culms* erect or somewhat geniculately ascending, up to 50 cm. high, not very rigid, about 7-noded, markedly branched from the nodes; internodes up to 10 cm. long, always exserted, subterete or compressed, striate and glabrous; nodes glabrous and always exserted. *Leaf-sheaths* about 2·5–3 cm. long, glabrous, striate, compressed, slightly keeled, lax, scaberulous towards the margin, always shorter than the respective internode and smooth. *Ligule* reduced to a ring of short hairs; auricles glabrous more rarely somewhat bearded. *Leaf-blades* up to 12 cm. long but often much shorter, flat or conduplicate, about 2 mm. wide, the margins minutely scaberulous and involute upwards, glabrous and striate on the lower surface, upper surface striate, minutely scaberulous and bearing a few long hairs towards the ligule. *Panicle* well-exserted, up to 6 cm. long, densely glomerate and spike-like, obovate in outline; *rhachis* striate, angular; *branches* very short and scaberulous. *Spikelets* densely congested, subsessile, lanceolate. *Glumes* about 7 mm. long, subequal, linear-lanceolate; the lower awned often from a bifid apex, awn and keel scaberulous, minutely scaberulous upwards towards the margin; the upper emarginate and shortly awned, keel glabrous, slightly scaberulous upwards towards the margin. *Lemma* lanceolate, up to 7 mm. long, 3-nerved, markedly scabrous in its upper two-thirds, glabrous towards the base, the margins more or less involute. *Callus* very short, rounded, densely bearded. *Awns* scabrous, up to 30 mm. long, the lateral often much shorter.

SOUTH WEST AFRICA.

Tsumeb, IV. 1934, *Dinter* 7600 (B); Ossa, III. 1939, *Volk* 1557 (D).

TYPE SPECIMEN.

Dinter 7600 is deposited in the Botanisches Museum, Berlin-Dahlem. This species bears a superficial resemblance to *A. hordeacea* Kunth which, however, belongs to § *Pseudochaetaria* whereas *A. Hubbardiana* mihi must be placed in § *Chaetaria* owing to the absence of an articulation in the lemma. The nearest ally to our species is *A. elliptica* (Nees) Kunth from which it differs in several minor characters. This is another of the rather remarkable cases where two closely allied species are found in South America and Western Africa, respectively!

42. **A. recta** *Franchet* in Bull. Soc. d' Autun **8**, 365 (1896) ; Hennard Crit. Rev. **3**, 500 (1928) ; Hennard Monogr. **2**, 261 cum ic. tab. 125 (1932) ; Theron in Fedde, Rep. **40**, 22 (1936).

A. atroviolacea Hack. apud Schinz in Bull. Herb. Boiss. Ser. 2. **6**, 707 (1906) ; Hennard Crit. Rev. **1**, 45 (1926). *A. Gossweileri* Pilger in Engl. Bot. Jahrb. **39**, 598 (1907) ; Hennard Crit. Rev. **1**, 206 (1926). *A. Hocki* De Wildeman in Bull. Jard. Bot. Brux. **6**, 39 et tab. 35 fig. 1-6 (1919) ; Hennard Crit. Rev. **2**, 237 (1927).

Perennial, densely caespitose, erect ; innovations intravaginal. *Culms* erect, exserted, elegant, 10-30 cm. high, simple, glabrous, striate, subcompressed, 1-(2)-noded ; internodes included. *Leaf-sheaths* subterete, glabrous, striate ; the lower somewhat lax and eventually breaking up into fibres ; the upper somewhat tighter and with a submembranous margin ; *ligule* a ciliolate rim ; auricles bearded ; collar smooth ; *blades* basal, setaceous involute, about up to 20 cm. long (often much shorter) and up to 1 mm. wide, striate, smooth on the lower surface, upper surface scaberulous, subobtuse or acute, often somewhat curved or flexuous. *Panicle* ovate-lanceolate in outline, up to 8 cm. long and 4 cm. wide, lax but not very diffuse ; axis filiform, smooth, scaberulous upwards, straight or more usually somewhat flexuous ; branches capillary, scaberulous, flexuous, ascending, binate or 3-5-partite, naked in their lower half to one-third, the lower branches up to 3 cm. long, the upper much shorter ; pedicels much longer to shorter than the glumes. *Spikelets* aggregated towards the end of the branches, brownish-purple to dark-purple. *Glumes* subequal to unequal ; the lower lanceolate-ovate, shortly awned, 1-nerved, 3-keeled, scabrous along the keels, 2.5-6 mm. long ; the upper linear-lanceolate, shortly awned, 1-nerved, glabrous, 5-7.5 mm. long. *Lemma* tubulous, somewhat narrowed upwards into a short column, smooth, pallid or grey in colour, scaberulous below the awns, 4-5 mm. long ; *callus* about 0.25 mm. long, rounded and obtuse, shortly bearded ; awns subequal, scabrous, curved or flexuous, purple.

A tufted annual, including the inflorescence up to 60 cm. high or even taller, at times very much smaller and dwarfed. Culms erect or somewhat geniculately ascending, more or less branched from the base and from the lower nodes, terete, striate, smooth, the upper nodes well-exserted. Leaf-sheaths more or less shorter than the internodes, tight, often slipping from the culms, compressed and keeled, smooth to scaberulous, striate, margins hyaline; ligule a ciliolate rim; auricles pubescent; collar glabrous; blades narrowly linear, tapering to a fine point, flat at the base or more usually folded throughout their length, up to 15 cm. long and 1–2 mm. wide, glabrous and striate on the lower surface, scabrous hirtellous on the upper surface, margins thickened. Panicle exserted, dense,

rather narrow, up to 20 cm. long, 1–2 cm. broad, more or less interrupted at the base, axis scabrous, terete below, angular upwards; branches scabrous, binate or branched almost from the base, the longer branches often peduncled, the shorter subsessile; pedicels scabrous, fairly short. Spikelets yellowish, greenish or tinged with purple. Glumes unequal, linear-lanceolate to lanceolate-oblong; the lower 4–7 mm. long, emarginate and shortly mucronate at the apex, scabrous on the keel and strigose on the flanks, laterally compressed; the upper up to 8 mm. long, smooth on the keel below, scaberulous upwards, bifid and with a short apical mucro from the sinus. Lemma usually purple-mottled, compressed, punctulate all over, scabrous on the keel, at times scabrous on the flanks upwards, up to 10 mm. long; callus rounded, densely bearded, 0·5–0·75 mm. long; awns erect or spreading, scabrous, unequal; the central about 20 mm. long, the lateral about 15 mm. long.

BECHUANALAND PROTECTORATE.

Francistown, IV. 1929, *Gordon* 52 (N). Mochudi, V. 1914, *Harbor* s.n. (BH, D).

TYPE SPECIMEN.

Ecklon (et *Zeyher*) from Uitenhage is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Bruine-gras. Steekgras. Stickgrass.

ECONOMIC NOTES.

This species, while young, is excellent for feeding cattle and sheep. In the mature state it is no longer palatable. The mature florets are very troublesome in wool and the awns often penetrate the skins of animals. The florets furthermore cause lameness in animals by penetrating the regions between their claws.

45. **A. submucronata** Schumach. in Sel. phys. og Mathem. Skr. **3**, 67 (1827); Hennard Crit. Rev. **3**. 609 (1928); Hennard Monogr. **2**. 321 cum ie. tab. 157 (1932).

A. Thonningii Trin. et Rupr. Spec. Gram. Stip. 137 (1842); Hennard Crit. Rev. **3**. 632 (1928).

Annual, tufted. *Culms* erect, or somewhat geniculately ascending, branched from near the base and the lower nodes, including the panicle up to 75 cm. high; internodes terete, striate, exserted; nodes rather swollen, glabrous. *Leaf-sheaths* tight and terete, at length fairly lax, keeled and slipping from the culms, striate, smooth to slightly scaberulous, shorter than the internodes; *ligule* a ciliate rim; auricles ciliate; collar glabrous; *blades* narrowly linear, up to 40 cm. long and 1-2 mm. wide, flat or involute, scaberulous on both surfaces, margins thickened. *Panicle* erect, subspiciform, interrupted; branches fairly shortly peduncled and sessile, especially the upper, fascicled; pedicels fairly short. *Spikelets* greenish suffused with purple, yellowish at maturity, erect, congested. *Glumes* unequal, linear-lanceolate; the lower scabrous along the keel and more or less so on the flanks, up to 6 mm. long, gradually tapering into the short awn; the upper somewhat scabrous along the keel, bilobed with a short awn from the sinus, up to 7 mm. long. *Lemma* compressed, exceeding the glumes, about 9 mm. long, purple-mottled, scabrid along the keel upwards, or even scabrous in the upper half, punctulate; *callus* rounded, densely bearded, about 0.5 mm. long; awns subequal to unequal, very scabrous, winged, up to 15 mm. long.

TYPE SPECIMEN.

The type "Guin. Dr. Thon. 356" is deposited in the Schumacher Herbarium, Copenhagen.

ECONOMIC NOTES.

This species is only eaten in the pre-flowering condition by bovines.

46. **A. adscensionis** L. subsp. *guineensis* (Trin. et Rupr.) Hennard Crit. Rev. **1**. 216 (1926); Hennard Monogr. **2**. 325 cum ie. tab. 159 (1932).

A. adscensionis Linn., sec. Obermeijer, Schweickerdt et Verdoorn in Bothalia **3**. II. 227 (1937), non Linn. *A. guineensis* Trin. et Rupr. Spec. Gram. Stip. 137 (1842); Walp. Ann. Bot. **3**. 744 (1852); Steud. Syn. Pl. Glum. **1**. 139 (1854).

Plants placed under this subspecies superficially greatly resemble slender specimens of *A. curvata* (Nees) Trin. et Rupr., but may be distinguished from this species by the following characters: *Panicle* long and many-flowered, branches thin and spreading, naked at the base, the whole thus being lax and interrupted. The *glumes* and *lemmas* are usually shorter than those of typical *A. curvata* (Nees) Trin. et Rupr.

TYPE SPECIMEN.

Drège 3881 is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Duin-steekgras. Los-steekgras.

ECONOMIC NOTES.

This species is abundant in disturbed areas. In the young condition it is eaten by cattle and game, but in the more mature condition it forms indifferent grazing. On the whole it is not considered to be of much value as a fodder grass. It stands drought well. In the mature condition it is a pest to sheep farmers and thus is a troublesome weed. The natives use the culms for making brushes.

REMARKS.

This species in its typical form may readily be distinguished from *A. congesta* Roem. et Schult. by the open inflorescence. There are, however, very many intermediates which link up the two species, and such specimens can only be named arbitrarily. It is very probable that much natural hybridisation occurs among these species, since they frequently grow in association and also flower during the same period.

48. *A. alopecuroides* Hack. in Verh. Bot. Ver. Prov. Brandenb. **30**. 114 (1888); Dur. et Schinz, Conspl. **5**. 800 (1894); Hack. in Bull. Herb. Boiss. **4**. Append. III. 17 (1896); Garabedian in Ann. S. Afr. Mus. **16**. II. 400 (1925); Henrard Crit. Rev. **1**. 22 (1926); Henrard Monogr. **1**. 121 cum ic. tab. 43 (1929).

Robust caespitose *perennial*. Culms erect, simple, up to 90 cm. high, 3-4-noded; internodes somewhat compressed, glabrous, smooth and striate; nodes exserted. Leaf-sheaths glabrous, smooth or slightly scaberulous, striate, compressed, tight; ligule a densely ciliolate rim; auricles pubescent or bearded; collar pubescent or bearded; blades linear, acuminate, up to 20 cm. long and 3 mm. wide, flat at the base, convolute upwards, glabrous and smooth beneath, scabrous and hirtellous on the upper surface. Panicle exserted, contracted, linear, elongate, spike-like, dense, up to 20 cm. long and 3 cm. broad, interrupted only at the very base; axis terete, scaberulous below; branches solitary, much-branched from near the base; branchlets and pedicels scabrous, short, fascicled, axils pubescent or glabrous. Spikelets erect, linear, scaberulous, congested. Glumes subequal; the lower very scabrous on the keel, including the 4 mm. long awn about 9-10 mm. long; the upper scabrous on the keel upwards, up to 12 mm. long including the 3 mm. long awn, apex bifid. Lemma about 6 mm. long, tubulous, narrowed into the column, granular and finally densely tubercled upwards; callus 1 mm. long, acute, densely hairy; column 4-6 mm. long, twisted, scabrous; awns subequal, 20-25 mm. long, scabrous, spreading.

SOUTH WEST AFRICA.

Olukonda, I. 1886, Schinz 656 (K, N, V, Z).

TYPE SPECIMEN.

Schinz 656 is deposited in the Naturhistorisches Museum, Vienna.

49. A. Pilgeri Henrard Crit. Rev. 2. 443 (1927); Henrard Monogr. 1. 123 cum ic. tab. 45 (1929).

Robust caespitose *perennial*. *Culms* erect, including the inflorescence up to 150 cm. high, simple, glabrous, glaucous, striate, terete, 3-6-noded; internodes exserted; nodes glabrous. *Leaf-sheaths* shorter than the internodes, usually pallid, margins finely ciliolate; *ligule* minutely ciliolate; auricles glabrous or bearded; collar glabrous or bearded with reflexed hairs; *blades* from a flat base, gradually acuminate, laxly convolute upwards, upper leaves involute, up to 35 cm. long, fairly rigid, glabrous on the lower surface, scabrous on the upper surface and along the margins, finely but not prominently nerved. *Panicle* dense, more or less contracted, at times subspicate, up to 40 cm. long and 5 cm. wide; axis terete or subangular, striate; branches solitary, up to 11 cm. long, erect or almost adpressed, much-branched from the base; branchlets adpressed. *Spikelets* densely imbricate, shortly pedicelled, pallid. *Glumes* somewhat unequal, awned; the lower 7.5-9 mm. long including the 1.5-2 mm. long awn, scaberulous in the upper half, keel and nerves scabrous, abruptly narrowed into the short awn; the upper 10-12 mm. long including the 2 mm. long awn, linear-lanceolate, keel smooth, bidentate at the apex. *Lemma* 6-7 mm. long including the column, linear or subfusiform, finely punctulate, finely scaberulous towards the apex; *callus* 0.75-1 mm. long, subobtuse, bearded; column of the awns about 1.5 mm. long, scaberulous, twisted; awns almost equal, somewhat spreading, scabrous, 10-20 mm. long.

TYPE SPECIMEN.

Dinter 2938 is deposited in the Rijksherbarium, Leiden.

ECONOMIC NOTES.

Several collectors state this species to be of little or no value as a fodder plant as it is too tough and hard.

50. A. *longicauda* Hack. in Boll. Soc. Brot. 6. 143 (1888); Dur. et Schinz, Consp. 5. 804 (1894); Henrard Crit. Rev. 2. 305 (1927); Henrard Monogr. 1. 122 cum ic. tab. 44 (1929).

Perennial, caespitose, with several innovations. *Culms* erect, simple or somewhat branched from the upper nodes, up to 80 cm. high; internodes more or less terete or slightly compressed, glabrous and smooth; nodes glabrous, exserted. *Leaf-sheaths* shorter than the internodes, terete or somewhat keeled upwards, glabrous, striate; *ligule* a short ciliolate rim; auricles long-bearded but hairs deciduous; collar bearded or glabrous; *blades* convolute, filiform, up to 30 cm. long and 2 mm. wide, glabrous and striate on the lower surface,

scaberulous on the upper surface. *Panicle* long-exserted, densely spike-like, contracted, up to 20 cm. long but often very much shorter, somewhat interrupted at the base; branches solitary, scaberulous, the lower naked at the base, the upper almost sessile, much-branched, adpressed; branchlets and pedicels short, scaberulous, densely fascicled. *Spikelets* congested, shortly pedicelled or subsessile, greenish or tinged with purple. *Glumes* unequal, shortly awned; the lower about 4.5 mm. long, scaberulous on the keel and on the flanks upwards, awn about 2 mm. long; the upper about 6 mm. long, keel glabrous, flanks very minutely strigose upwards, awn about 3 mm. long. *Lemma* tubulous, narrowed into the column, finely granular and somewhat scaberulous dorsally upwards, about 5-6 mm. long including the 1.5 mm. long densely bearded acute *callus*; column about 5 mm. long, twisted, scaberulous; awns fine, spreading, scaberulous, subequal, up to 2.5 cm. long.

PORTUGUESE EAST AFRICA.

Lourenco Marques, VII. 1922, *Moss* 6906 (WR).

TYPE SPECIMEN.

There are four sheets collected by *Lichtenstein* which are deposited in the Botanisches Museum, Berlin-Dahlem. The original labels on the sheets say " *Aristida coarctata* ".

The specimens are overmature. There is another sheet in the Willdenow Herbarium, Berlin, which is an excellent match of Lichtenstein's gatherings. Although this sheet does not state the collector, it bears the name "*A. coarctata* Licht." and from its perfect match I do not hesitate to say that it is part of the original gathering. This sheet has been named up by Henrard as *A. congesta* Roem. et Schult.

The above-mentioned five sheets undoubtedly represent the type gathering, and the part of this in the Willd. Herbarium has actually been studied by Henrard.

COMMON NAMES.

Buffalo grass. Duin-steekgras. Klossaad. Rotstert-steekgras. Steekgras.

ECONOMIC NOTES.

This species is considered to be poor grazing, but quite a good hay if it is cut early. When mature it is a pest to the sheep farmer and is supposed to have no fodder value to speak of. It is, however, an important annual in overgrazed and tramped-out areas. In the wilted condition this species has been found to contain large amounts of prussic acid.

REMARKS.

Examination of Lichtenstein's gatherings and the type of *A. barbicollis* has revealed the fact that the auricles of the leaves are bearded. Owing to the overmature condition of the Lichtenstein specimens most of the hairs have disappeared, and it is only on some leaves that the beards are still present. Stapf in Dyer, Fl. Cap. 7. 552 (1899) has used the presence or absence of the bearded auricles as a key-character to distinguish between *A. barbicollis* and *A. congesta*. Although some specimens actually have glabrous auricles, this character does not appear to be coupled with the contracted inflorescence. I have seen several specimens with open panicles typical of *A. barbicollis* in which the auricles are perfectly glabrous. This distinguishing character must thus be discarded as it is of no taxonomic value. In my opinion the shape of the panicle, viz., contracted, or lax and open, appears to be the only character upon which the two species in question may be distinguished. There are, however, many intermediates which can only be named arbitrarily. Having furthermore examined a fair number of "dwarfed specimens" I have come to the conclusion that *A. Rangei* is most probably nothing else but a first year flowering condition of *A. congesta*. Field study and breeding experiments will probably support the opinion expressed above.

52. *A. spectabilis* Hack. in Bull. Herb. Boiss. 3. VIII. 380 (1895); Stapf in Dyer, Fl. Cap. 7. 562 (1899); Stent in Bothalia 1. IV. 278 (1924); Henrard Crit. Rev. 3. 577 (1928); Henrard Monogr. 1. 93 cum ic. tab. 25 (1929); Theron in Fedde, Rep. 40. 26 (1936).

Densely caespitose rather robust perennial. Culms erect, stout, up to 1·5 m. high, simple, terete, sheathed nearly all along. Sheaths exceeding the internodes, glabrous, smooth, often with a flake of wool at the mouth and from there somewhat woolly along the margins downwards, the upper inconspicuously striate; auricles of lowermost sheaths usually bearded, those of the uppermost sheaths usually glabrous. Leaf-blades linear, involute, firm, tapering to a setaceous apex, smooth on the lower surface, prominently nerved and minutely scaberulous on the upper surface, up to 60 cm. long, 4-5 mm. wide at the base, somewhat glaucous. Panicle oblong to ovate, lax and open, nodding, 30-40 cm. long, the axis smooth, with distant binate or solitary branches up to 20 cm. long, which in turn are again branched from near their base, the secondary, tertiary, etc., branchlets and pedicels minutely scaberulous, the latter as long as or much longer than the glumes. Spikelets glabrous, yellowish or greenish. Glumes linear-lanceolate, acute, rather firm, with hyaline erosely dentate tips and narrow margins, 1-nerved, smooth, subequal, about 10-12 mm. long. Lemma linear, about 6·5-7·5 mm. long inclusive of the callus, smooth or dorsally

minutely scaberulous upwards. *Callus* up to 1 mm. long, densely bearded, bifid. Column of awns strongly twisted, nearly glabrous, 5–6 mm. long; awns scaberulous, erect or spreading, unequal, the central up to 44 mm. long, the lateral awns up to 28 mm. long. *Anthers* 5 mm. long.

TRANSVAAL PROVINCE.

TYPE SPECIMEN.

Rehmann 4695 in the Botanisches Museum, Zürich, and the Naturhistorisches Museum, Wien are both in Hackel's own hand and thus together constitute the type.

ECONOMIC NOTES.

Owing to the very wiry nature of the culms and the stiff leaves, this species is unpalatable.

REMARKS.

The author of the present paper has repeatedly searched for this species at the type locality, Koedoespoort, near Silverton, but so far has not been successful in finding it in that locality. The species, however, is comparatively frequent but local in some parts of the Pretoria district and a wide series of specimens has recently been collected. The plants usually occur in large dense tussocks in sandy depressions on the northern slopes of the Magaliesberg. They are readily recognisable by their strictly erect habit and the half-nodding panicles which give them a very characteristic appearance. The plant may easily be confused with *A. diffusa* Trin. var. *Burkei*, but differs from this variety by having subequal glumes, the tips of which are hyaline.

53. *A. stipoides* Lam. Encycl. Method. 157 (1791); Henrard Crit. Rev. 3. 591 (1928); Henrard Monogr. 1. 93 cum ic. tab. 26 (1929).

A. stipoides Lam. var. *meridionalis* Stapf sec. Garabedian in Ann. S. Afr. Mus. **16**. II. 405 (1925) pro parte, non Stapf. *A. gracillima* Oliv. in Trans. Linn. Soc. **29**. 173 (1875) cum ic. 114 fig. 1; Dur. et Schinz, Conspl. **5**. 803 (1895); Hack. in Bull. Herb. Boiss. **4**. Append. III. 18 (1896).

Robust *perennial*, loosely tufted. *Culms* simple or branched from the upper nodes, up to 100 cm. high; internodes glabrous, slightly striate; nodes glabrous, exserted. *Leaf-sheaths* shorter than the internodes, glabrous, striate; *ligule* a short ciliate rim; auricles woolly; *blades* narrow, flat or involute, up to 20 cm. long, 3–4 mm. wide, smooth on the lower surface, striate and scaberulous on the upper surface. *Panicle* effuse, very lax and open, up to 30 cm. long, scarcely flowered; branches bi- or tri-nate, glabrous or scaberulous; pedicels capillary, flexuous or curved or straight, scaberulous, with suberlavate tips. *Glumes* pallid, or tinged with purple especially at the base, very unequal, glabrous; the lower up to 7 mm. long, ovate-lanceolate; the upper narrowly linear, 15–20 mm. long, mucronate from a bifid apex. *Lemma* terete, including the callus up to 9 mm. long, smooth but punctulate upwards; *callus* slender, about 2 mm. long, bifid, densely hairy; column of awns scabrous, twisted, 2.5–3 cm. long; awns subequal, scabrous, up to 5.5 cm. long.

WITHOUT PRECISE LOCALITY.

Burke et Zeyher 1810 (O).

TYPE SPECIMEN.

Thunberg's gathering is deposited in the Thunberg Herbarium, Upsala.

COMMON NAMES.

Beesgras. Bushmangrass. Hardegras. Teesuikergras.

ECONOMIC NOTES.

This species prefers shallow rocky soil where it is often abundant. It stands drought well but is of little value as a fodder.

REMARKS.

Buchanan 124 (BH, K) from Leribe, *Burtt Davy* 9375 (N) from Ermelo, and *Atherstone* s.n. from near Lydenburg also belong to this species, but I very much doubt whether the localities indicated by these gatherings are correct.

Gatherings such as *Burchell* 1842 and *Wolff* 17 differ from typical *A. vestita* in that their culms are somewhat fascicled. This give them an appearance akin to species such as *A. Enqleri* and *A. dasydesmis*. They may however be distinguished from the latter species by the adpressedly woolly internodes.

55. *A. meridionalis* Henrard Crit. Rev. 2. 344 (1927); Henrard Monogr. 1. 95 cum ic. tab. 27 (1929); Obermeijer, Schweickerdt et Verdoorn in Bothalia 3. II. 227 (1937).

A. stipoides Lam. sec. Stent in Bothalia 1. IV. 278 (1924), non Lam. *A. stipoides* Lam. var. *meridionalis* Stapf in Dyer, Fl. Cap. 7. 562 (1890); Dinter in Fedde, Rep. 15. 342 (1918); Henrard Crit. Rev. 3. 592 (1928).

Perennial, compactly caespitose. *Culms* erect, simple or somewhat branched, up to 2 m. high, 2-3-noded; internodes glabrous, striate, fairly thick in robust specimens: nodes usually dark in colour, glabrous, exserted. *Leaf-sheaths* striate; the lower usually densely woolly especially those of the innovations; the upper usually glabrous and smooth; *ligule* a short ciliolate rim; auricles with a dense flake of wool, long hairy; collar glabrous; *blades* narrow, usually involute, up to 50 cm. long and 5 mm. wide, striate and glabrous on the lower surface, scabrous on the upper surface. *Panicle* large, very lax and effuse, up to 50 cm. long and over 20 cm. wide, many-flowered; rhachis smooth; branches 2-3-nate, repeatedly branched, smooth or scaberulous; pedicels capillary, flexuous, scaberulous, with sub-clavate tips, shorter to much longer than the glumes. *Glumes* unequal, glabrous; the lower 5-7 mm. long; the upper 10-15 mm. long. *Lemma* terete, 7-9 mm. long, mottled with purple, smooth or slightly punctulate, scaberulous upwards; *callus* 1.5-2 mm. long, slender, densely hairy, bifid; column of awns slender, twisted, up to 2 cm. long; awns subequal, up to 5 cm. long.

TYPE SPECIMEN.

Dinter 2476 is deposited in the Rijksherbarium, Leiden.

COMMON NAMES.

Haygrass. Klossaad.

ECONOMIC NOTES.

This species is said to be used as a hay-grass during bad seasons. Owing to its coarseness it is not readily eaten by stock.

REMARKS.

Henrard in Crit. Rev. 1. 345 (1927) states that the species was described by Dr. Stapf as a variety of *Aristida stipoides* in Flora Capensis Vol. 7. p. 562 . . . ". Henrard, however, has selected *Dinter* 2476 in Herb. Leiden as the type and does not use the double citation for his species. It is therefore obvious that he has not based his species on Stapf's variety and that the use of the same epithet "*meridionalis*" does not indicate the raising of the variety to specific rank. It is a pity that Henrard did not select a different epithet to designate his species; it would have precluded any doubt as to whether he has based his species on Stapf's variety or not.

56. **A dasydesmis** Mez in Fedde, Rep. **17**. 148 (1921); Hennard Crit. Rev. **1**. 131 (1926); Hennard Monogr. **1**. 95 cum ic. tab. 26 (1929); Theron in Fedde, Rep. **40**. 23 (1936).

A. angustata Stapf sec. F. Bolus in Ann. S. Afr. Mus. **9**. IV. 232 (1915), non Stapf. *A. vestita* Thunb. sec. Steud. Syn. Pl. Glum. **1**. 142 (1854) pro parte; F. Bolus in Ann. S. Afr. Mus. **9**. IV. 232 (1915) pro parte, non Thunb. *A. vestita* Thunb. var. *parviflora* Trin. et Rupr. Spec. Gram. Stip. 158 (1842); Walp. Ann. Bot. **3**. 747 (1852); Stapf in Dyer, Fl. Cap. **7**. 561 (1899); F. Bolus in Ann. S. Afr. Mus. **9**. IV. 232 (1915); Hennard Crit. Rev. **3**. 668 (1928). *Arthratherum vestitum* (Thunb.) Nees, Fl. Afr. Austr. 174 (1841); Drège, Zwei Pflanzengeogr. Doc. 90 (1843), non *Aristida vestita* Thunb.

Perennial, caespitose. *Culms* many-noded, erect, much-branched from the lower nodes, the fascicled branches culm-bearing, giving the whole plant a very characteristic appearance, glabrous. *Leaf-sheaths* glabrous, the lower soon deciduous, the upper at length slipping from the culms; *ligule* a ciliate rim; auricles minutely pubescent; *blades* more or less erect and stiff, smooth and subpungent, involute, about 1 mm. wide. *Panicle* somewhat contracted, at times fairly dense, up to 10 cm. long and 3 cm. wide; branches binate, the upper usually simple, adpressed to the rhachis; branchlets and pedicels slightly scaberulous; the latter shorter than or as long as the glumes. *Glumes* unequal, glabrous; the lower about 5 mm. long, the upper up to 8 mm. long. *Lemmas* tubulous, glabrous, including the callus up to 8 mm. long; *callus* 1 mm. long, bearded, truncate, obliquely truncate, rounded or slightly emarginate; column of awns twisted, about 5 mm. long; awns slightly unequal, the central up to 25 mm. long, the lateral up to 20 mm. long.

CAPE PROVINCE.

Little Namaqualand distr.: Iaus, IX. 1897, Schlechter 11228 (A, B, K, N); Ratel Poort, XII. 1909, Pearson 2952 (A, BM, K, N, S); Zilverfontein, Drège (B, BM, G, K, LG, N, O, P, S, V); Rietfontein, XII. 1908, Pearson 3768 (BH, K); Rietkloof mountain, II. 1910, Pearson 5719 (BH, K); Alewynsfontein, XII. 1908, Pearson 3487 (A, BH, BM, D, K, N, S); Kweekfontein, I. 1909, Pearson 3803 (A, BM, S). Aberdeen distr.: Camdeboo-berg, Drège s.n. (LG). Gordonia distr.: Twinkoppies, III. 1937, Acock 2053 (K).

TYPE SPECIMEN.

Schlechter 11228 is deposited in the Botanisches Museum, Berlin-Dahlem.

REMARKS.

The articulation at the apex of the lemma is not always well-developed, in fact Pearson 3487 shows the presence of lemmas which are very inconspicuously articulated. As the specimens constituting this gathering are over-mature, the normally developed lemmas have probably already been shed and only the imperfectly developed lemmas have not yet disarticulated.

57. **A. Engleri** Mez in Fedde, Rep. **17**. 147 (1921); Garabedian in Ann. S. Afr. Mus. **16**. II. 402 (1925); Hennard Crit. Rev. **1**. 170 (1926); Hennard Monogr. **1**. 96 cum ic. tab. 29 (1929); Range in Fedde, Rep. **33**. 8 (1933).

Aristida stipoides Lam. var. *meridionalis* Stapf sec. Garabedian in Ann. S. Afr. Mus. **16**. II. 405 (1925) pro parte, non Stapf. *Aristida vestita* Thunb. sec. F. Bolus in Ann. S. Afr. Mus. **9**. IV. 232 (1915) pro parte; Garabedian in Ann. S. Afr. Mus. **16**. II. 406 (1925); Range in Fedde, Rep. **33**. 10 (1933); omnes non Thunb.

The facies of this species so closely resembles that of *A. dasydemis* Mez that unless the spikelets are dissected these two species are not to be distinguished with any degree of certainty. *A. Engleri* has a lemma which is dorsally distinctly scaberulous, furthermore the callus is distinctly bifid whereas in *A. dasydesmis* the callus is truncate or slightly emarginate and the lemma is dorsally glabrous.

TYPE SPECIMEN.

Burke 165 is deposited in The Herbarium, Royal Botanic Gardens, Kew.

COMMON NAMES.

Besemgras. Koperdraadgras. Steekgras. Teesuikergras.

ECONOMIC NOTES.

Opinion differs as to the value of this species. It is said in one case that cattle relish this species, whereas in other cases it is said to be particularly unpalatable even in the young condition. It is supposed to be one of the least palatable grasses in the mountain area. The fruits penetrate the skins of animals and so are injurious to stock.

REMARKS.

Careful examination of the type (Kew) and isotypes (British Museum, South Afr. Museum) has shown that the lemmas of many spikelets are more or less articulated. This articulation may at times be rudimentary or even absent in many spikelets, but its position and nature is similar to that typical of the well-defined § *Arthratherum*. The degree of development of the articulation in any particular specimen appears to be more or less correlated with the age of that specimen. The presence of a distinctly bifid callus and the very unequal glumes are furthermore important characters in support of my view that *A. Burkei* Stapf has been placed incorrectly by earlier authors in the § *Chaetaria*. The species must moreover be removed from that section to find its natural position in § *Arthratherum*. Because of its close affinity to *A. diffusa* Trin. I have placed it as a variety under that species.

Theron in Fedde, Rep. 14. 7 (1936) places *A. Burkei* in the same category as *A. Marlothii* Hack. and *A. Dregeana* (Nees) Trin. et Rupr. The two last-named species are typical representatives of the § *Stipagrostis*, and members belonging to this section form a morphologically well-defined group. In my opinion it is taxonomically impossible to class together a typical representative of the § *Arthratherum* with members of the § *Stipagrostis*. For this reason I am unable to accept Theron's suggested classification. It may however be possible to subdivide the existing organographic sections more satisfactorily on basis of a combined consideration of the organographic and anatomical characters. Such an investigation (to which cytological investigation could be coupled) would certainly yield interesting results. This work however lies wholly beyond the scope of the present paper.

58b. *A. diffusa* Trin. var. *Pseudo-Hystrix* (Trin. et Rupr.) Henrard Crit. Rev. 3. 471 (1928); Henrard Monogr. 1. 97 (1929).

A. diffusa Trin. var. *brevestipitata* (Trin. et Rupr.) Henrard Crit. Rev. 3. 665 (1928); Henrard Monogr. 1. 97 (1929). *A. pseudohystrix* (Trin. et Rupr.) Steud. Syn. Pl. Glum. 1. 142 (1854). *A. vestita* Thunb. sec. Steud. Syn. Pl. Glum. 1. 142 (1854) pro parte, non Thunb. *A. vestita* Thunb. var. *brevestipitata* Trin. et Rupr. Spec. Gram. Stip. 158 (1842); Walp. Ann. Bot. 3. 747 (1852). *A. vestita* Thunb. var. *Pseudo-Hystrix* Trin. et Rupr. Spec. Gram. Stip. 158 (1842); Walp. Ann. Bot. 3. 747 (1852); Dur. et Schinz, Conspl. 5. 810 (1894).

The facies of this variety closely resembles that of the species but differs from it by the very short column of the awns. The length of the column is somewhat variable, it may be almost completely absent or reach a length of up to 4 mm. This variation at first led the author of this paper to place one and the same gathering viz. Zeyher 447 under both the vars. *brevestipitata* and *pseudohystrix*. Ecklon and Zeyher s.n. from Uitenhage at one time shared the same lot. Study of more comprehensive material however has shown that the forms of *A. diffusa* having short columns (up to 4 mm.) should all be placed under the var. *Pseudo-Hystrix*.

The specimen on which *Trinius* et Ruprecht based their description is deposited in the *Trinius Herbarium*, Leningrad. It bears no data as to collector or precise locality but "Ar. vestita var. A. *Pseudohystrix* Cap. b. sp. 1837".

59. **A. mollissima** Pilger in Engl. Bot. Jahrb. **40**. 80 (1908) ; Schultze, Namaland et Kalahari 581 (1907) nomen tantum ; Henrard Crit. Rev. **2**. 354 (1927) ; Henrard Monogr. **1**. 99 cum ic. tab. 30 (1929).

A. elymoides Mez in Fedde, Rep. **17**. 148 (1921) ; Henrard Crit. Rev. **1**. 166 (1926).

A densely caespitose erect fairly robust *perennial*, including the culms up to 80 cm. high. Culms strictly erect, many-noded, simple, or more rarely scantily branched from the upper nodes ; nodes glabrous ; internodes exserted, up to 20 cm. long, densely woolly or lanate-tomentose, more or less terete, greenish. Leaf sheaths pallid ; the lower lax and slipping off the culms, striate, almost glabrous or fairly densely tomentose ; the upper sheaths glabrous, striate, smooth, terete and tight ; *lirule* a short hairy rim, auricles with a flake of wool or merely ciliate ; collar glabrous or minutely pubescent ; blades linear (the lower) to filiform (the upper), up to 30 cm. long and 3 mm. wide, but usually much shorter, and narrower, involute, erect or somewhat spreading, acute, lower surface glabrous, smooth and striate, the upper surface scaberulous, tip acute but not pungent. Panicle usually sheathed by the uppermost leaf or shortly exserted, narrow, very dense and spike-like, up to 20 cm. long ; axis densely lanate ; branches numerous and very short, adpressed, somewhat lanate. Spikelets almost sessile, narrow, glabrous, pallid, erect. Glumes very unequal, shortly awned narrowly-lanceolate, 1-nerved, scabrous on the keel, and minutely scaberulous upwards ; the lower from 10-14 mm. long ; the upper from 17.5-24 mm. long. Lemma including the callus and up to the articulation 8.5-10 mm. long, tubercles, smooth and very minutely granular ; callus 2-2.5 mm. long, acute, densely but shortly hairy ; column of the awns 17-26 mm. long, strongly twisted, scabrous ; awns more or less equal, scabrous, spreading, 2.8-5.5 cm. long.

Robust erect caespitose perennial. Culms simple below but usually branched from the upper nodes, up to 120 cm. high, about 5-noded; internodes more or less equal, terete, obscurely striate, glabrous, somewhat glaucous; nodes glabrous, exserted. Leaf-sheaths glabrous, striate; the lower more or less rigid, lax, the upper fairly lax, glaucous and at length slipping from the culms; ligule a ciliate rim; auricles densely long-bearded or only pubescent; collar pubescent or glabrous; blades variable in length, up to 30 cm. long, linear, usually convolute, erect or spreading, glabrous and striate on the lower surface, scaberulous on the upper surface. Panicles erect, sub-spicate to fairly lax and interrupted, about 20 cm. long, branches adpressed to the rhachis or eventually spreading on maturity, solitary to 3-nate, angular, scaberulous on the angles; pedicels slightly scaberulous, usually shorter than the glumes. Glumes unequal, acute, awned; the lower about 10 mm. long, scaberulous on the keel; the upper up to 20 mm. long, minutely scaberulous upwards. Lemma tubular, somewhat mottled with purple, glabrous, finely punctulate, including the callus up to 11 mm. long; callus very acute, densely hairy, 2 mm. long; column of awns very variable in length, up to 25 mm. long, strongly twisted; awns subequal, capillary, spreading, up to 60 cm. long.

TYPE SPECIMEN.

Schlechter 11984 is deposited in the Botanisches Museum, Berlin-Dahlem.

Common Name.

Stekgras.

ECONOMIC NOTES.

Opinion differs as to the value of this species as a fodder for stock. It is stated to be eaten in South West Africa whereas in the Western Transvaal and the Orange Free State it is reported to be very coarse and thus unpalatable.

Annual, usually fairly robust and much-branched from the base and lower nodes. *Culms* up to 85 cm. high including the inflorescence, or in weak specimens 20-30 cms. high, erect or somewhat geniculately ascending, several-noded; internodes fairly rigid, compressed, striate, densely pubescent with spreading or reflexed short hairs, sometimes becoming almost glabrous, usually exserted; nodes constricted, more or less densely pubescent. *Leaf-sheaths* striate, compressed, keeled, pubescent, with narrow hyaline margins, usually shorter than the internodes; *ligule* shortly ciliate; auricles shortly bearded; collar smooth; *blades* linear-lanceolate, more or less glaucous, flat or folded lengthwise, keeled, acute, scabrous on both surfaces or hirtellous above, many-nerved, up to 30 cm. long and 0.9 cm. wide. *Panicle* linear-oblong or subovate, exserted, in robust plants up to 24 cm. long, but usually much shorter, densely contracted, compact and spike-like, usually only somewhat interrupted at the base; peduncle and axis densely pubescent; branches solitary much-divided from the base; branchlets and spikelets fascicled; pedicels short and pubescent. *Spikelets* congested, linear-lanceolate, greenish or pallid in colour. *Glumes* lanceolate, manifestly awned, 1-nerved, keeled, bifid near the apex, scaberulous dorsally; the lower scabrous on the keel, from 6-11 mm. long excluding the 2.5-5 mm. long awn; the upper smooth on the keel, 7-12 mm. long excluding the 1-4 mm. long awn. *Lemma* narrowly linear, fusiform, with many longitudinal lines of characteristic spiny hairs from the base to the summit, ventrally somewhat furrowed, narrowed towards the apex, up to 7.5 mm. long including the callus, articulation evident; *callus* rounded, short, densely bearded, about 0.5 mm. long; awns subequal, scabrous, erect or somewhat spreading, from 35-50 mm. long.

ANGOLA.

BECHUANALAND PROTECTORATE.

Francistown, IV. 1929, *Gordon* 49 (N).

TYPE SPECIMEN.

The type is deposited in the Botanisches Museum, Berlin-Dahlem.

COMMON NAMES.

Sauergras. Wilde Gerste.

ECONOMIC NOTES.

This species is not readily eaten by stock. In the young condition however it is eaten to some extent, whereas in the mature condition it is injurious on account of the awns which penetrate the palates of stock.
