Background: The variety of applications in which the Vegetation Map of South Africa, Lesotho and Swaziland (VEGMAP) is used requires the map to be continually updated and refined to reflect the latest available information. The VEGMAP has been updated twice, in 2009 and 2012, since its first release in 2006.

Objectives: The first objective is to report on the motivations for changes in the 2009 and 2012 versions. The second objective is to describe new vegetation types and subtypes included in these versions.

Method: Changes to the VEGMAP are implemented after a peer-review process that is managed by the National Vegetation Map Committee. Accepted changes are then incorporated into the VEGMAP using GIS software.

Results: Seventy-one of the 449 vegetation types were affected by updates. Changes included the addition of new vegetation types and subtypes, modifications to the boundaries of types present in the 2006 VEGMAP and changes to the names of vegetation types.

Conclusion: The updates have affected a small portion of the map but have reflected a progressive refinement in quality. Regions that are still mapped at a coarse scale, especially those earmarked for land-use development, should be prioritised for improved map accuracy and classification through a more proactive approach towards vegetation mapping, using guidelines that are under development.

Introduction

The National Vegetation Map of South Africa, Lesotho and Swaziland (VEGMAP) (ed. Mucina & Rutherford 2006) is a geographical classification of groups of plant communities across South Africa. The project was a collaboration between vegetation experts in the early 2000s under the custodianship of the South African National Biodiversity Institute (SANBI). Uses for the VEGMAP are widespread and cross-sectorial. Therefore, SANBI has a responsibility to ensure that the map reflects the most up-to-date knowledge available. Similar to early versions of vegetation maps in other parts of the world (Barbour, Todd Keeler-Wolf & Schoenherr 2007), the first version of the VEGMAP was based on the best available data at the time and implemented through a largely top-down approach as vast regions of the country had been poorly sampled. While some areas of the map were developed from existing fine scale maps and floristic data (~6% of the map), much of the vegetation map was inferred from environmental predictors of floristic biogeography such as geology (~8%), climate (~5%), topography (~0.1%), bioresource units (~5%), land types (~42%) and satellite imagery (~7%) (Mucina, Rutherford & Powrie 2006). Consequently, the VEGMAP is effective in representing natural vegetation communities at the national scale, but the top-down classification is less effective at the local scale (Barbour et al. 2007; Greenberg et al. 2006). There is thus a process through which the National Vegetation Map can be updated to improve its mapping accuracy in large parts of the country.

The 2009 and 2012 updates of the VEGMAP drew on suggestions and queries submitted by botanists and ecologists working at SANBI and various partner organisations. These versions were made available on the Biodiversity GIS (BGIS) website (www.bgis.org.za) since 2009, where full descriptions of each new vegetation type were recently (2016) added as downloadable portable documents (pdf). However, the justifications for re-classification of vegetation types and additions of new types have not been formally published. This paper highlights areas edited in the 2009 and the 2012 updates. We justify these changes and provide summary descriptions of the new vegetation types and subtypes.

Methods

Data requirements for changes to the Vegetation Map of South Africa, Lesotho and Swaziland

Proposed changes require review and validation before they can be accepted. Therefore, a National Vegetation Map Committee (NVMC) was formed in 2007. Similar to other international classification committees, such as the vegetation subcommittee of the American Federal Geographic Data Committee (FGDC 2008) and the Canadian National Vegetation Classification Technical Committee, the NVMC provides technical direction for the VEGMAP project and ratifies proposed changes where sufficient justification has been submitted. The minimum information required for a proposed change will depend on the nature of the change. Minor changes include changes to the boundaries of existing vegetation types and updates to the descriptions. Major changes include the proposal of new vegetation types or merging of existing types. The minimum information required for a change to be accepted includes: (1) a digital map of proposed boundaries; (2) detailed justification for the various changes (often with satellite imagery, aerial photographs or orthophotographs); (3) for new vegetation types and subtypes the justification must include a broad description of the landscape, vegetation structure, associated geology, soils, landscape features and climate, lists of dominant and diagnostic species, conservation status and (optionally) threats; and (4) a georeferenced colour photograph with a caption. Major changes must be accompanied by a peer reviewed publication or report.

Results

Summary of changes to the Vegetation Map of South Africa, Lesotho and Swaziland

The sources of changes implemented in the updates include vegetation mapping for fine scale planning (Helme 2007a, 2007b, 2007c; Helme & Koopman 2007; Van der Merwe et al. 2008a, 2008b; Vlok, Cowling & Wolf 2005), provincial planning (Scott-Shaw & Escott 2011) and field work conducted by members of the NVMC. Accepted changes to the VEGMAP have included alterations to the boundaries of vegetation types classified in 2006: changes to the spelling of vegetation type names (4), the addition of new vegetation types (11) and the addition of subtypes of existing vegetation types (9). The reasons for changes ranged from ground truthed (direct observation of vegetation patterns in the field) evidence to evidence based on re-analysis using updated satellite imagery (Table 1).

Ground-truthing was the most common form of evidence (90% of the affected vegetation types) used to justify changes, often supplemented by information on floristic, geomorphological, structural or geological distinctness. Minor changes in 2012 included changing the names of four vegetation types to remove the circumflex (^) from the region name '*Rūens*'. This was aimed at eliminating errors in computer syntax.

The boundaries of 43 vegetation types were edited in the 2009 version and four in the 2012 version. New vegetation types were added mainly in KwaZulu-Natal, Mpumalanga and the Western Cape provinces (Figure 1). Six new vegetation types and nine subtypes (mainly in the Western and Northern Cape provinces) were added in 2009, and six types were added in 2012. Four of the new vegetation types (SKk9, SVI25, SVI26 and SVI27) were described in the Succulent Karoo biome, with two each from the Fynbos (FFs32, FFh11) and Grassland (Gs19, Gs20) biomes, and one from the Indian Ocean Coastal Belt (CB6). One vegetation type (FFa5 Olifants Alluvium Fynbos) was added in 2009 from fine scale planning, but it was removed in 2012 as supporting evidence was insufficient to justify the change. Three of the five sources of accepted updates emerged out of provincial or city-funded fine scale planning projects. New polygons were added (W5 Reclaimed Land) to represent the current extent of a small portion of coast in Table Bay that was filled in during upgrades to Cape Town Harbour in the 1940s. This area was not historically vegetated and is mapped but not considered to be a vegetation type.

A condensed version of the descriptions for new vegetation types and subtypes added in 2009 and 2012 versions is outlined in Tables 2 and 3.

Discussion

Overall, the 2009 and 2012 versions of the VEGMAP have been progressive refinements in scale and accuracy compared to the 2006 version, although these are limited to a few regions. Recent versions have also allowed for the inclusion of finer scale data in the form of subtypes. A problem remains as when to allow subtypes in a way that prevents a proliferation of vegetation units that will compromise the national scale of VEGMAP. Subtypes vary in scale, and in the criteria used to define them; thus some subtypes are represented by several units spread over larger geographies (e.g. FS1.2 Graafwater Flats Strandveld), while others are represented by a single isolated unit (e.g. FRs8.2 Kluitjieskraal Silcrete Renosterveld). This has the potential to become problematic as the units for types are refined, and approach the same scale as the units currently mapped as subtypes. This occurrence can only be avoided by a clear and well-defined classification hierarchy.

The VEGMAP changes to date were driven by a relatively passive approach to data acquisition, from private botanical consultants and government conservation officials raising concerns about the current map, and providing information from fine scale planning work. Consequently, updates have been concentrated in areas where funding, capacity and historical baseline information was available. Areas that have been updated so far coincided with three principal regions and two centres of plant endemism, namely, Kamiesberg Centre of the Cape Floristic Region, the Little Karoo Centre of the Succulent Karoo Region and a large extent of the Maputaland-Pondoland Region (Steenkamp et al. 2005).

TABLE 2: Names, vegetation map codes and summarised descriptions of new vegetation types added to the Vegetation Map of South Africa, Lesotho and Swaziland since the original 2006 publication.

Name of new type	Distribution and protection	Landscape features & vegetation	Geology, soils and climate	Species composition
SKk 9 Koebe Succulent Shrubland ^a	Extends from the west of Nieuwoudtville southwards to an area between Klawer and Dongingbos. Relatively untransformed (mainly due to inaccessibility) but barely protected. Small areas impacted by roads and gravel quarries, agricultural fields, and small dams. Appears to be prone to overgrazing. Previously mapped as SKn6 Kamiesberg Mountain Shrubland (46%), FRS1 Vantynhondsort Shale Renosterveld (21%), SKu1 Doringvlei Quartzite Karoo (18%), SKk4 Knersvlakte Shale Vygied (5%), and marginal portions of FFs1 Bokkeveld Sandstone Fynbos, SKk5 Vantynhondsort Gammabosveld, SKs13 Klauer Sandy Shrubland. The unit did not fit comfortably within these units, either structurally or floristically.	Medium tall shrubland with many deciduous and succulent shrubs. Fynbos elements rare and trees only amongst rocky outcrops (<i>Ficus</i> , <i>Martynia</i> , <i>Diaspurys</i>) and in moister areas (Oleo). Grasses rare - may be because of heavy grazing. Bulbs and annuals uncommon.	Occurs not only on substrates of mainly medium to coarse-grained quartzitic sandstone but also on mudrocks, sandstones, siltstones, limestone and shales. Predominantly on land type lb and lc. MAP approximately 200 mm–350 mm.	Dominant taxa: <i>Euphorbia burmannii</i> (Klotzsch & Garcke), <i>Aloe cornosa</i> Marloth & A. Berger, <i>Lampranthus watermeyeri</i> N.E. Br., <i>Tylecodon paniculatus</i> (L.F.) Toelken, <i>Crossula rupestris</i> L.f., <i>Searsia lucida</i> (L.) F.A. Barkley, <i>Searsia undulata</i> (Jacq.) T.S.Y. A.J.Mill. & J.Wen, <i>Lebeckia citoisoides</i> Thunb., <i>Lebeckia lepidotiana</i> Jacq., <i>Pteronia divaricata</i> (P. Bergius) Pteronia pallens L.f., <i>Didelpha spinosa</i> (L.f.) Aiton, <i>Tripterys oppositifolia</i> (Aiton) B. Nord., <i>Pentzia incana</i> (Thunb.) Kunze, <i>Galenia africana</i> L., <i>Montinia canophyllacea</i> Thunb., <i>Theesium lineare</i> Spreng. ex A.D.C., <i>Lotononis maximiliani</i> De Wild., <i>Dodonaea angustifolia</i> L.f., <i>Zygophyllum morgana</i> L., <i>Euphorbia tenuanii</i> Comp. ex A.D.C., <i>Galenia sarcophylla</i> Fenzl, <i>Conyledon orbiculata</i> L., <i>Fingerhuthia officinalis</i> Lehmann. Biogeographically important taxa: <i>Aloe comosa</i> Marloth & A. Berger, <i>Rhynchosia arida</i> C.H.Smit. Near Endemic taxa: <i>Eriospermum minutipustulatum</i> , <i>Moraea macgregori</i> , <i>Rhynchosia arida</i> .
SVI 25 Maputaland Pallid Sandy Bushveld ⁴	On the Maputaland coastal plain region east of the Pongola River. Aligned with the Muzi swamp and its water catchment and to the south it extends to Hluhluwe between SVI 18 and CB 1. Altitude 0 m–90 m. Statutorily conserved in Tembe Elephant Park and Isimangaliso Wetland Park. Previously mapped as CB1 Maputaland Coastal Belt (81%), SVI18 F0a1 Lowveld Riverine Forest, A2f6 Subtropical Freshwater Wetlands and AZ111 Subtropical Salt Pans. The unit extends to the Maputaland part of southern Mozambique. It differs from SV18 Tembe Sandy Bushveld in the higher clay content of the soils and higher water table and lower evaporation rates arising from its proximity to the east coast.	On ancient coastal dune cordons on gently undulating terrain. Open to closed evergreen woodland with canopy 5 m–10 m tall.	Quaternary sediments of marine origin – mainly grey regic to reddish redistributed sand dunes. Grey brown to orange grey dystric regosols. Land type mainly Ha.	Dominant taxa: <i>Ureletrum agropyroides</i> (Hack.) Hack., <i>Sapium integrerrimum</i> Hochst., <i>Albizia versicolor</i> Oliv., <i>Ditheroopogon amplexens</i> (Nees) Clayton, <i>Indigofera complanata</i> (Schum.) Wight, <i>Antidesma venosum</i> E. Mey ex Tul., <i>Fimbristylis complanata</i> (Reitz) Link, <i>Cordia monoica</i> Roxb., <i>Sclerocarya birrea</i> (A.Rich.) Hochst., <i>Molinia repens</i> (Willd.) Zizka, <i>Rothmannia fischartii</i> (Schum.) Bullock ex Oberm., <i>Pteroxylon obliquum</i> (Thunb.) Radlk., <i>Strychnos henningsii</i> Gilg, <i>Andropogon schirensis</i> Hochst., <i>Tephrosia longipes</i> Meissner subsp. <i>longipes</i> .
SVI 26 Muzi Palm Veld and Wooded Grassland ³	On the coastal plain in the Maputaland region east of the Pongola River between SVI 18 and CB 1. Altitude 40 m–90 m. Statutorily conserved in Tembe Elephant Park. Previously mapped as CB1 Maputaland Coastal Belt (80%), SVI18 Tembe Sandy Bushveld (14%) A2f6 Subtropical Freshwater Wetlands (5%), and marginal portions of CB2 Maputaland Wooded Grassland, F0z8 Sand Forest, W1 Freshwater Lakes and AZ111 Subtropical Salt Pans. The unit extends to the Maputaland part of southern Mozambique. It differs from Eastern Maputaland Pailid Sandy Bushveld in the generally higher and very seasonal water table which is unsuitable for bushveld trees. Small unmappped fragments of Muzi Palm Veld and Wooded Grassland occur embedded in mainly Mkuzi River and the Nyala River.	Gently undulating terrain on ancient coastal dune cordon. Dry basins associated with Muzi Swamps and Stream draining Pongola and Mkuzi River. Two broad plant communities: <i>Hypoxene</i> a. coriacea (in seasonally wet palm Veld lacking in shrubs and herbs) and wooded grassland (rich in shrubs, dwarf shrubs, geophytic suffrutices and herbs) dominate in a patchwork pattern.	Quaternary sediments of marine origin – mainly grey regic to reddish redistributed sand dunes. Grey brown to orange grey dystric regosols. Land type mainly Ha.	Dominant taxa: <i>Hyphaena coriacea</i> Gaertn., <i>Drypetes arguta</i> (Müll.Arg.) Hutch., <i>Uvaria lucida</i> subsp. <i>vires</i> (N.E.Br.) Verdc., <i>Spirostachys africana</i> Sond., <i>Berberis zeyheri</i> (Sond.) Grubov., <i>Senegalia burkei</i> (Benth.) Kyal. & Boatw., <i>Euclea natatalensis</i> A.DC., <i>Midrella auncifolia</i> DC., <i>Jussiaea flava</i> (Forssk.) Vahl, <i>Imperata cylindrica</i> (L.) Raeusch., <i>Eragrostis lapulosa</i> Nees, <i>Oxalis cf. semilibata</i> Burm.f.
FRs 20 Citrusdal Shale Renosterveld ^{1b}	Threatened by agricultural expansion, alien invasive vegetation (invasive grasses e.g. <i>Avena</i> spp. and herbs, urban expansion (mainly around Citrusdal), dams. Heavy grazing and trampling pressure. Nothing conserved. Previously mapped as SK7 Citrusdal Vygied (79%), Ff2 Graafwater Sandstone Fynbos (7%), and marginal portions of Ff54. Cederberg Sandstone Fynbos, Ff-02 Leipoldtville Sand Fynbos and FFs3 Olifants Sandstone Fynbos. Previously included within Citrusdal Vygied but clearly distinct (structurally and floristically), occurring on cooler/moister slopes, and dominated by shrubs rather than succulents.	Typical Renosterveld, dominated by low to medium shrubs, with abundant annuals and geophytes. Herbs can be common, but trees are usually not present, and succulents are uncommon to common (more common where transitional to Citrusdal Vygied), on drier slopes. Alien vegetation tends to be rare, but invasive alien grasses are a threat. Hueweltjes may be present.	Occurs not only on substrates of mainly quartzitic sandstone but also on mudrocks, sandstones, siltstones and shales. Predominantly on land type la and lb. MAP approximately 250 mm–350 mm.	Dominant taxa: <i>Searsia incisa</i> (L.f.) F.A.Barkley, <i>Wilborgia leptoptera</i> R.Dahlgren, <i>Didelpha spinosa</i> (L.f.) Aiton, <i>Lebeckia citoisoides</i> Thunb., <i>Euclea tomentosa</i> E.Mey. ex A.D.C., <i>Berkheya fruticosa</i> (L.) Ehrl., <i>Diospyros ramulosa</i> (E.Mey. ex A.D.C.) De Winter, <i>Dicerathamus rhinocerotis</i> (L.f.) Koek, <i>Eriocephalus africanus</i> L., <i>Pteronia incana</i> (Burm.) DC., <i>Anthospermum spathulatum</i> Spreng., <i>Zygophyllum spinosum</i> L., <i>Nylandia spinosa</i> (L.) Dumort, <i>Chrysocoma ciliata</i> L., <i>Montinia canophyllacea</i> Thunb., <i>Mohria caffra</i> (L.) Desv., <i>Chellianthes namaquensis</i> Scheele, <i>E. burmannii</i> , <i>Euhorbia lorifolia</i> Lam., <i>Tetragonia rosea</i> Schlt., <i>Ehrharta calycina</i> Sm., <i>Tribolium hispidum</i> (Thunb.) Desv., <i>Geissois hirsuta</i> Aspera Goldblatt, <i>Wurmbea spicata</i> (Burm.f.) T.Durand & Schinz., <i>Bulbinella caudo-tells</i> (L.f.) T.Durand & Schinz., <i>Babiana angustifolia</i> Sweet, <i>Monnea flaccida</i> (Sweet) Steud., <i>Cyanella hyacinthoides</i> Roem ex L., <i>Lotononis hisrtute</i> (Thunb.) D.Dietr., <i>Cynilla bulbosa</i> (L.) P.J.Bergius, <i>Arctopus monacanthus</i> Camich. ex Sond., <i>Heilichysum moeserianum</i> Thell., <i>Hemimeris racemosa</i> (Houtt.) Merr., <i>Onosiphon suffruticosum</i> (L.) Källersjö. Endemic taxa: <i>Lotononis macrocarpa</i> Eckl. & Zeyh., <i>L. rosea</i> Duemmer, <i>L. pallens</i> Benth., <i>Oxalis amblosepala</i> Schltr., <i>O. uliginosa</i> Schltr. Near Endemic taxa: <i>Polycaena subtilis</i> , <i>Geissorhiza lousiabolusia</i> R.C.Foster, <i>Sparaxis roxburghii</i> (Baker) Goldblatt.

Table 2 continues on the next page

TABLE 2 (Continues...): Names, vegetation map codes and summarised descriptions of new vegetation types added to the Vegetation Map of South Africa, Lesotho and Swaziland since the original 2006 publication.

Name of new type	Distribution and protection	Landscape features & vegetation structure	Geology, soils and climate	Species composition
FFs 32 Nardouw Sandstone Fynbos ^a	With a small distribution in the south-east of Vanrhynsdorp in the Western Cape. Threatened primarily by the ongoing expansion of rooibos tea cultivation, overgrazing and fire exclusion. Rocky areas are relatively safe. Previously mapped as FFs1 Bolkeveld Sandstone Fynbos (60%). FFs4 Cederberg Sandstone Fynbos (28%) and marginal portions of SKv1 Doringvlei Quartzite Karoo, SKv2 Hantam Karoo, SKv6 Kamiesberg Mountains Shrubland, SKv5 Vanrhynsdorp Gannabosveld and FFs1 Vanrhynsdorp Shale Renosterveld. A much more arid type than Bolkeveld Sandstone Fynbos or Cederberg Sandstone Fynbos (250mm/yr), is floristically distinct, and supports significantly fewer endemic species.	Structurally a typical arid Fynbos shrubland. Large areas of weathered rock, supporting dwarf succulents and shrubs, lichens and mosses. Graminoids and proteoids common and often dominant, but Ericaceae is poorly represented. Less prominent wetlands and Thicket than in Bokkeveld or Cederberg Sandstone Fynbos, and trees largely absent except on fire protected rocky outcrops. Waboomveld is absent. Annuals and bulbs are common in open areas and in young veld, and succulents often common on rocky pavements.	Acidic, moist clay-loamy, red-yellow apedal Glenrosa and Mispath forms derived from Malinesbury Shales. Land types Ac, Fa Ic, MAC 520 mm-1650 mm. Mean daily temperatures between 26.4°C and 6.6°C. Frost incidence 2 or 3 days per year.	Dominant taxa: <i>Leucadendron pubescens</i> R. Br., <i>Aristida diffusa</i> Trin., <i>Restio vimineus</i> Rottb., <i>Eriorthiza thunbergii</i> Gibbs Russ., <i>Restio marlothii</i> Pilans, <i>R. monanthos</i> Mast., <i>Isolepis marginata</i> (Thumb.) A. Dietr., <i>Thomnochortus playtaxis</i> Kunth, <i>Willdenowia glomerata</i> (Thunb.) H.P.Linder, <i>Willdenowia incurvata</i> (Thunb.) H.P.Linder. Biogeographically important taxa: <i>Gladiolus splendens</i> (Sweet) Herb., <i>Leucadendron loranthifolium</i> L.A. Williams, <i>Lampranthus paethensis</i> L. Bolus, <i>Leucospermum praemorsum</i> (Nees) E. Phillips. Endemic taxa: <i>Babiana engysiphon</i> J.C. Manning & Goldblatt, <i>B. rigida</i> Goldblatt & J.C.Manning, <i>B. unguiculata</i> G.J.Lewis, <i>Othonna papaveroidea</i> Hutch., <i>Wahlenbergia</i> sp. nov., Near endemic taxa: <i>Amphiglossa grisea</i> Koek., <i>Athanasiella spathulata</i> (DC.) D.Dietr.
FFh 11 Peninsula Shale Fynbos ²	Higher hills and lower mountain slopes on the Cape Peninsula at Devil's Peak on south and east aspects. Separated from Boland Shale Fynbos by the dominance of Silvertrous and an understorey of Rooigras. Altitude 0 m-700 m. Well conserved in the Table Mountain National Park. Heavy infestation of <i>Acacia mearnsii</i> De Wildtman and <i>Acacia melanoxylon</i> . Previously mapped as FFh5 Cape Winelands Shale Fynbos (62%), FFg3 Peninsula Granite Fynbos (5.6%), and marginal portions of FFg9 Peninsula Sandstone Fynbos, FFd5 Cape Flats Sand Fynbos and FO21 Southern Afrotemperate Forest.	Steep slopes against the mountains. Vegetation is moderately tall and dense. Shrubland structurally dominated by proteoid and closed-scrub Fynbos with strong grass elements, dominated by <i>Themeda triandra</i> .	Acidic, moist clay-loamy, red-yellow apedal Glenrosa and Mispath forms derived from Malinesbury Shales. Land types Ac, Fa Ic, MAC 520 mm-1650 mm. Mean daily temperatures between 26.4°C and 6.6°C. Frost incidence 2 or 3 days per year.	Dominant taxa: <i>Leucosidea sericea</i> Eckl. & Zeyh., <i>Leucadendron aristata</i> (DC.) H.Rob., <i>Searsia discolor</i> (E.Mey. ex Sonn.) Moffett, <i>Rubus ludwigii</i> Eckl. & Zeyh., <i>Lopholaena coriifolia</i> (Sond.) E.Philips & C.A.Sm., <i>Othonium wilmstii</i> (Harms) C.H.Sch., <i>Tristachya leucocephala</i> (Sond.) E.Philips & C.A.Sm., <i>Harporchloa fax</i> (L.f.) Kunze, <i>Andropogon schirensis</i> Hochst., <i>Monocymbium ceresiiforme</i> (Nees) Stapf, <i>Acalypha wilmsii</i> Pax ex Prain & Hutch., <i>Argyroxiphium tuberosum</i> Eckl. & Zeyh., <i>Helichrysum adenocarpum</i> subsp. <i>adenocarpum</i> , <i>Lobelia flaccida</i> (C.Presl) A.DC. Biogeographically important taxa: The flora of the Steenkampsberg Montane Grassland is more common to the north than to the south, e.g. <i>Aloe modesta</i> Reynolds and <i>Watsonia watsonioides</i> (Bakker) Oberm. It also shares local endemics with the Long Tom Pass Montane Grasslands: <i>Disa klugii</i> McMurtry, <i>Khadia aitola</i> Chess. & H.E.K.Hartmann, <i>Brachystelma stellatum</i> E.A.Bruce & R.A.Dyer, <i>Indigofera longibracteata</i> Engl. Endemic taxa: <i>Searsia tumulicola</i> var. <i>meseana</i> Moffett, <i>Crotonia monophylla</i> Germish., <i>Indigofera heterodonta</i> var. <i>steenkampianus</i> Eckl. & Zeyh., <i>Kniphofia rigidifolia</i> E.A.Bruce, <i>Rhoeoexia aberrans</i> R.A. Dyer, <i>Streptocarpus latens</i> Hilliard & B.L.Burtt, <i>Gladiolus costaracarum</i> Oberm., <i>Gymnostomum malvinum</i> Goldblatt & J.C.Manning, <i>Grindelia linearifolia</i> Codd, <i>Xysmalobium pedifoerium</i> S.P. Bester & Nicholas, <i>Eucomis vandermerwei</i> Verdc., <i>Drimiopsis purpurea</i> Van der Merwe, <i>Aloe chollisii</i> Van Jaarsv. & A.E.Van Wyk.
Gm 30 Steenkampsberg Montane Grassland ²	Occurs along the Steenkampsberg escarpment that extends from the headwaters of the Waterfall River in mountains north-west of Lydenburg, extending southwards through Dullstroom towards Belfast, then eastwards through Machadoorp to Bambi and Elandshoogte. Poorly protected but over 70% is still natural. Previously mapped as Gm18 Lydenburg Montane Grassland (100%), which was split into Gm30 and Gm31. A floristic analysis along the Mpumalanga escarpments supports the recognition proposal of two subcentres of plant endemism, namely the Long Tom Pass subcentre and the Steenkampsberg subcentre.	Mountainous with plateau grasslands, mountain slopes and shallow valleys. Grasslands are short with high forb diversity. The highest point in Mpumalanga (2330 m) occurs just north of the Steenkampsberg Pass.	Forms part of the Pretoria Group (intersected by Transvaal Database), with the several hill formations running from west to east. Rocks are quartzite, shale, dolerite, diabase and basalt. Soils are shallow to deep, well drained; either dystrophic and/or mesotrophic depending on geology. Soil derived from quartzitic results in sandy, white dystrophic soils with high humus content. Seasonally arid temperate region with hot summers and cool and dry winters. Winter frost is common and summer mist is infrequent. Its inland position and higher elevation than the Long Tom pass Montane Grasslands, it is colder and receives significantly less mist during summer.	Dominant taxa: <i>Protea roupelliae</i> Meisn. subsp. <i>roupelliae</i> , <i>Protea parvula</i> Beard, <i>Phymospermum acerosum</i> (DC.) Kälersjö, <i>Sporaea latifolia</i> , <i>Clifftoria nititilia</i> Weim. subsp. <i>pilosissima</i> , <i>Erica woodii</i> Bolus, <i>Andropogon schirensis</i> Hochst., <i>Festuca costata</i> Nees van. <i>costata</i> , <i>Alloteropsis semialata</i> subsp. <i>ekloniana</i> (Nees) Gibbs Russ., <i>Cenium concinnum</i> Nees, <i>Loudetia densipila</i> (Rendle) C.E.Hubb., <i>Microthlasialaeta</i> (Rendle) Staf., <i>Microthlasia caffra</i> Nees, <i>Diheteropogon filifolius</i> (Nees) Clayton, <i>Harpochloa falx</i> (L.f.) Kunze, <i>Koeleria capensis</i> Nees, <i>Scirpus flexuosa</i> Beuckels, <i>Helichrysum wilmstii</i> Moeser, <i>Helichrysum glomeratum</i> Klatt, <i>Helichrysum spiralepis</i> Hilliard & B.L.Burtt, <i>Helichrysum subulatum</i> Burtt, <i>Sopubia cana</i> Harv., <i>Eriosema kraussianum</i> Messner, <i>Selegia aetheroneura</i> Rolfe, <i>Gladiolus longicollis</i> var. <i>platypterus</i> (Baker) Goldblatt & J.C.Manning, <i>Pammotrophopsis myriantha</i> Sond., <i>Xysmalobium aceratoideum</i> (Schiltz.) N.E. Br., <i>Synclastostemon subvelutinus</i> (Gurke) D.F.Otieno.
Gm 31 Long Tom Pass Montane Grassland ²	Along the escarpment, from Morgenster Reserve just north of Crystal Springs Mountain Lodge, southwards to the Schoemanskloof. Altitude around 1650 m in the north (where it is drier), to around 1500 m in the south. This type is well protected and target of 27% is met. Previously mapped as Gm18 Lydenburg Montane Grassland (100%), which was split into Gm30 and Gm31. A floristic analysis along the Mpumalanga escarpment supports the recognition proposal of two subcentres of plant endemism, namely the Long Tom Pass subcentre and the Steenkampsberg subcentre.	Physiography is diverse with subalpine peaks, level terraces and rolling plains in the higher lying areas with steeply sloping mountain slopes. The highest point is Mount Anderson (2280 m), occurring just north of Long Tom Pass.	Well drained, shallow soils with pockets of silty clay loam. Seasonally arid temperate region with hot summers and dry winters. Frost (winter) and mist (summer) is common. Compared to the Steenkampsberg Montane Grassland, it is warmer and receives more mist.	Table 2 continues on the next page

TABLE 2 (Continues...): Names, vegetation map codes and summarised descriptions of new vegetation types added to the Vegetation Map of South Africa, Lesotho and Swaziland since the original 2006 publication.

Name of new type	Distribution and protection	Landscape features & vegetation structure	Geology, soils and climate	Species composition
Gs 19 Dry Coast Hinterland Grassland ^d	From Melmoth in the north to near Libode in the former Transkei (including Camperdown, Umlas Road, Eston, Bisi, Izingolweni, Ngeleni near Mhatha). Altitude 450 m–900 m. Statutorily conserved in Oribi Gorge Nature Reserve. Previously mapped as SVs4 Ngongoni Veld (86%), and marginal portions of SVs6 Eastern Valley Bushveld, CB3 KwaZulu-Natal Coastal Belt, SVs3 KwaZulu-Natal Hinterland Thornveld, GS9 Midlands Mistbelt Grassland, SV122 Northern Shurland Sourveld, CB4 Pondoland-Uga Sandstone Coastal Sourveld, FO25 Scario Forest, GS11 Southern KwaZulu-Natal Moist Grassland, FO23 Southern Mistbelt Forest, SVs1 Thukela Valley Bushveld and SV123 Zululand Lowveld. Herbaceous species richness is much less in Dry Coast Hinterland Grassland compared with the adjoining vegetation units KwaZulu-Natal Sandstone Sourveld; Moist Coast Hinterland Grassland; Midlands Mistbelt Grassland and relatively few of its common species are shared with these. A Bioresource classification for the region (Camp 1999) refined vegetation into different types based on climate, and the presence and abundance of dominant plant species.	Undulating plains and hilly landscape mainly associated with drier coast hinterland valleys in the rain shadow of the rain bearing frontal weather systems from the east coast. Sour sparse wiry grassland dominated by unpalatable Ngongoni grass. In good condition dominated by <i>Themeda triandra</i> and <i>Tristachya leucothrix</i> . Wooded areas are found in valleys at lower altitudes. Termitaria with trees and shrubs present.	Acid, leached heavy soils derived from Karoo Super group and intrusive Karoo dolerites. Predominantly summer rainfall. Droughts occasional. MAP 750 mm to 780 mm. Frost infrequent. Mean monthly temperatures between 38.2°C and -0.2°C.	Biogeographically Important Taxa: Has links to Zimbabwean and southern Drakensberg flora. <i>Heilichrysum swynnertonii</i> S.Moore, <i>Brachystema stellatum</i> E.A.Bruce & R.A.Dyer, <i>Aloe offinna</i> A.Berger, <i>Khadia affricola</i> , <i>Morella microbracteata</i> (Wein.) Verdc. & Pohl. Endemic Taxa: <i>Callilepis normae</i> DC., <i>Erica aetherstoniae</i> Diels ex L.Guthrie & Bolus, <i>Erica revoluta</i> (Bolus) L.E.Davidson, <i>Erica subverticillaris</i> Diels ex L.Guthrie & Bolus, <i>Heilichrysum summo-montanum</i> L.Verdc., <i>Heilichrysum-aureum</i> sp nov., <i>Sprengelcarpus cyanescens</i> subsp. <i>long-tommi</i> , <i>Sprengelcarpus hilburtii</i> , <i>Disa amoena</i> H.P.Linder, <i>Disa clavicornis</i> H.P.Linder, <i>Desa coloratus</i> G.J.Lewis, <i>Gladiolus exiguum</i> T.J.Edwards, <i>Hesperantha saxicola</i> Goldblatt, <i>Gladiolus makubulanensis</i> Hawkey & T.J.Edwards.
Gs 20 Moist Coast Hinterland Grassland ^d	From near Melmoth in the north to near Libode in the south. Altitude 450 m–900 m. Statutorily conserved in Vernon Crookes and Entumeni Nature Reserves. Previously mapped as SVs4 Ngongoni Veld (98%), and marginal portions of SVs6 Eastern Valley Bushveld, CB3 KwaZulu-Natal Coastal Belt, SVs3 KwaZulu-Natal Hinterland Thornveld, GS9 Midlands Mistbelt Grassland, SV122 Northern Zululand Sourveld, CB4 Pondoland-Uga Sandstone Coastal Sourveld, FO25 Scario Forest, FO23 Southern Mistbelt Forest, SVs1 Thukela Valley Bushveld, CB5 Transkei Coastal Belt and SV123 Zululand Lowveld. A Bioresource classification for the region (Camp 1999) refined vegetation into different types based on climate, and the presence and abundance of dominant plants.	Rolling and hilly landscape. Dense tall sour grassland dominated by unpalatable Ngongoni grass with this mono-dominance associated with low species diversity, when in good condition dominated by <i>Themeda triandra</i> and <i>Tristachya leucothrix</i> .	Acid leached heavy soils derived from Karoo Super group sediments and intrusive Karoo dolerites. Predominantly summer rainfall. MAP 800 mm to 1150 mm. Frost infrequent.	Dominant taxa: <i>Aristida juncea</i> (L.) Hitchc., <i>Digitaria eriantha</i> Steud., <i>Digitaria leucothrix</i> Trin. & Rupr., <i>Themeda triandra</i> Forsk., <i>Tristachya leucothrix</i> Trin. ex Nees, <i>Alloteropsis semialata</i> (R.Br.) Hitchc., <i>Digitaria eriantha</i> Steud., <i>Digitaria tricholaenoides</i> Stapf, <i>Harpachloa falx</i> (L.f.) Kunze, <i>Acacia dealbata</i> Link, <i>A. mearnsii</i> Cyathia dregel Kunze, <i>Halleria lucida</i> L., <i>Podocarpus</i> spp., <i>Pteridium aquilinum</i> (L.) Kuhn, <i>Bartsia canescens</i> Pursh, <i>Sporobolus pyramidalis</i> P.Beauv., <i>Vachellia tortilis</i> (Forsk.) Galasso & Banfi, <i>Dichrostachys cinerea</i> .
CB 6 KwaZulu-Natal Coastal Belt Thornveld ³	From near Mandini to Oribi Gorge in the south. Altitude 30 m–500 m. Statutorily conserved in Harold Johnson Nature Reserve. Previously mapped as CB3 KwaZulu-Natal Coastal Belt (99%), and marginal portions of SVs6 Eastern Valley Bushveld, SVs5 KwaZulu-Natal Sandstone Sourveld, SVs4 Ngogoni Veld, FO27 Northern Coastal Forest, CB4 Pondoland-Uga Sandstone Coastal Sourveld, FO25 Scario Forest and W2 Subtropical Coastal Lagoons. This vegetation unit grades into the SVs 6 Eastern Valley Bushveld and SVs 3 KwaZulu-Natal Hinterland Thornveld in the larger river valleys.	Steep valley sides and hilly landscape mainly associated with drier larger river valleys in the rain shadow of the rain bearing frontal weather systems from the east coast. Bushed grassland and thicket, bushland and open woodland.	Summer rainfall with some rain in winter. MAP about 740 mm to 940 mm. Summers are hot and humid and winters mild. Frost does not occur.	Dominant taxa: <i>H. hirta</i> , <i>Sporobolus pyramidalis</i> P.Beauv., <i>V. tortilis</i> , <i>Combretum apiculatum</i> Sond., <i>Combretum molle</i> R.Br., <i>V. sieberiana</i> , <i>V. tortilis</i> , <i>Combretum apiculatum</i> Sond., <i>Euphorbia ingens</i> E.Mey. ex Boiss., <i>Euphorbia</i> spp. (trees), <i>R. caffra</i> , <i>Ziziphus mucronata</i> Willd.

TABLE 3: Names, vegetation map codes and summarised descriptions of new vegetation subtypes added to the Vegetation Map of South Africa, Lesotho and Swaziland since the original 2006 publication.

Name of new subtype	Justification for separation	Distribution and protection	Landscape features & vegetation structure	Geology, soils and climate	Species composition
FS1.2 Graafwater Flats Strandveld¹ Main Type: FS1 Lambert's Bay Strandveld	No trees and lack of proteoids, <i>Erica</i> , <i>Phyllisca</i> , <i>Diosma</i> , <i>Aspalathus</i> and <i>Nylantha scoparia</i> distinguish this unit from Leipoldtville Sand Fynbos. The unit has a higher resto component (<10%) than Lambert's Bay Strandveld. The unit has numerous annuals, and moderate to low geophyte diversity and abundance. <i>Pterocastrus</i> sp. and <i>Putterlickia</i> sp. are lacking.	On the coastal plain near Graafwater. Much of this unit is already transformed (mainly for cereals, with saltbush (<i>Atriplex</i>) the most commonly planted perennial). This is not a fire driven vegetation type. Alien vegetation covers about 5% of this unit, comprising <i>Acacia cyclops</i> , <i>Eucalyptus</i> sp., <i>Atriplex nummularia</i> , and <i>Prosopis</i> sp. Due to the flat topography, much of the northern part of the unit has been ploughed, but the areas are mostly too dry to support crops. In the northern parts of this unit many strip cultivated areas have been heavily grazed and only unpalatable and invasive kraalbos (<i>Galenia africana</i>) remains in the unploughed strips. The southern areas are threatened by potato farming.	Found on deep, loamy to neutral sands on the coastal plain halfway between the coast and the first line of mountains. No exposed bedrock and most areas well drained, although there are small pans where underlying clays are close to the surface. This is an ecotonal vegetation type, usually occurring between Lambert's Bay Strandveld and Leipoldtville Sand Fynbos or Grootfontein Sand Fynbos. Medium to tall shrubland, with high percentage of deciduous and succulent elements.	Semi-arid, and hot and dry in summer, with mild winters and occasional heavy mists and fog. Has a slightly lower incidence of fog than Lambert's Bay Strandveld.	Dominant taxa: <i>Searsia lucida</i> (L.) F.A.Barkley, <i>Searsia glauca</i> (Thunb.) Moffett, <i>Euclea racemosa</i> L., <i>Euclea tomentosa</i> E.Mey ex A.DC., <i>Diospyros pubescens</i> Pers., <i>Diospyros glabra</i> (L.) De Winter, <i>Roepera norgiana</i> (L.) Beier & Thulin, <i>Lebeckia sericea</i> Thunb., <i>Montinia caryophyllea</i> Thunb., <i>Pteronia divaricata</i> (P.Bergius) Less., <i>Wildoglia leptoptera</i> R.Dahlgren, <i>Chrysanthemoides incana</i> (Burm.f.) Norl., <i>Euryops speciosissimus</i> DC., <i>Asparagus capensis</i> L., <i>Struthiola ciliata</i> (L.) Lam., <i>Gymnosporia buxifolia</i> (L.) Szyszka, <i>Euphorbia burmannii</i> (Klotzsch & Gaertn.) E.Mey ex Boiss., <i>E. mauritanica</i> L., <i>E. caput-medusae</i> L., <i>Conicosia pugioniformis</i> (L.) N.E.Br., <i>Cotyledon orbiculata</i> L., <i>Ruschia</i> sp., <i>Jordaanella dubia</i> H.E.K., <i>Tetragonia fructuosa</i> L., <i>Othonna cylindrica</i> (Lam.) DC., <i>Wiliaeniella incurvata</i> (Thunb.) H.P.Linder, <i>Hertia calycina</i> Sm., <i>Willdenowia</i> <i>incurvata</i> (Thunb.) H.P.Linder, <i>Thamnochortus burchellii</i> Mast., <i>Grielium grandiflorum</i> (L.) Druce, <i>Kedrostis psammophilla</i> , <i>Glaadiolus carnarius</i> Aiton, <i>Albuca Canadensis</i> (L.) F.M.Leight., <i>Dimorphotheca piluvialis</i> (L.) Moench, <i>Arcotis hispida</i> (Harv.) Beauverd, <i>Dioscia uniflora</i> (Thunb.) Benth., <i>Cotula turbinata</i> L.
<i>Biogeographically important taxa: Potentially supports <i>Manulea pilansii</i>; <i>M. psilosoma</i>, <i>Felicia Josephinae</i> J.C.Manning & Goldblatt, <i>Selago heterotricha</i>, <i>Pelargonium attenuatum</i> Harv., <i>Pelargonium appendiculatum</i> (L.f.) Wild., <i>Goldblattia</i> & J.C.Manning, <i>Babiana confusa</i> (Eckl. & Zeyh.) C.H.Stirt., <i>Orthobolium uncinatum</i> (Eckl. & Zeyh.) C.H.Stirt.</i>					
FRs8.2 Kluitjeskraal Silcrete Renosterveld² Main Type: FRs8 Breede Shale Renosterveld	The distinguishing floristic feature is the presence of <i>Elegia extensa</i> . The presence of Silcrete is also unique.	Restricted to the western parts of the Tuberbagh valley, west of Worcester. The bulk of this single unit habitat was transformed into plantation and is restricted to patches where plantation density is low, notably under the Eskom powerline servitude that crosses this area. Not formally conserved.	Very similar to Breede Shale Renosterveld but with the key addition of Silcrete, which creates a unique gravelly substrate, not represented elsewhere in the area.	Occurs on phyllitic shale, greywacke, limestone and arenite. Predominantly on land types 1a and Fa. MAP approximately 700 mm–830 mm.	<i>Elegia extensa</i> Pilans. Other threatened species include <i>Leucadendron lanigerum</i> H. Buek ex Meisn., <i>Raffia cristata</i> C.H.Stirt., <i>Aspalathus aculea</i> Thunb., <i>Orthobolium canalicans</i> (Eckl. & Zeyh.) C.H.Stirt., <i>Orthobolium uncinatum</i> (Eckl. & Zeyh.) C.H.Stirt.
FFa2.2 Nekkies Silty Floodplain² Main Type: FFa2 Breede Alluvium Fynbos	Nekkies Silty Floodplain is part of the Breede river floodplain and may be more extensive than previously mapped. The unit is distinguished by its soil type and unique floristics and structure.	The best example lies between the Breede river and the Brandvlei dam (north of Nekkies ridge, west of Worcester, where this unit is in good condition. Not formally conserved and largely transformed.	The subtype resembles grassland with many bulbs.	Soils are deep loamy silts, which overlay the normal sandy soils and cobble alluvium of the Breede valley, and may be highly fertile.	<i>Themeda triandra</i> Forsk., <i>Elegia recta</i> (Mast.) Moline & H.P.Linder, <i>Restio tetragonus</i> Thunb., <i>Elegia asperiflora</i> (Nees) Kunth, <i>Staberoha distichos</i> (Rott.) Kunth, <i>Diospyros glabra</i> (L.) De Winter, <i>Eragrostis capensis</i> (Thunb.) Trin., <i>Chiaria linoides</i> L., <i>Wimmerella arabidea</i> (C.Presl) Serra, M.B.Crespo & Lammeres, <i>Aspalathus filiculifolia</i> Eckl. & Zeyh., <i>Ficinia</i> sp. and <i>Leucadendron brunioides</i> Meisn., <i>Satyrium</i> sp., <i>Babiana</i> sp., <i>Lachenalia</i> sp., <i>Watsonia meriana</i> (L.) Mill.
FRs2.2 Nieuwoudtville Sandstone Renosterveld³ Main Type: FRs2 Nieuwoudtville Shale Renosterveld	The subtype is very similar to Papkuilfontein Sandstone Renosterveld, but with many wild olives (<i>Olea europaea</i> subsp. <i>africana</i>).	This ecotonal unit occurs on the plateau, at the boundary of Shale Renosterveld and Sandstone Fynbos, from Outplaas to Matjiesfontein, further north than Papkuilfontein Sandstone Renosterveld. Much of the original extent has been transformed. Not formally conserved.	The habitat is flat, with shallow sandstones underlying sandy loams. The substrate is similar to Noord Bokkeveld, and also Papkuilfontein Sandstone Renosterveld.	The area is slightly wetter than similar habitat in the Noord Bokkeveld, and also more mesic than Papkuilfontein Sandstone Renosterveld.	<i>Olea europaea</i> subsp. <i>cuspidata</i> (Mall. & G.Don) Cif., <i>Scarsia glauca</i> , <i>Diospyros pubescens</i> , <i>Gymnosporia buxifolia</i> , <i>Wiborgia tetraptera</i> E.Mey., <i>Nylandtia spinosa</i> (L.) Dumort., <i>Passerina glomerata</i> , <i>Willdenowia incurvata</i> (Thunb.) Harv., <i>Dicerothamnus rhinocerotis</i> (L.f.) Koek., <i>Bulbinella nutans</i> (Thunb.) Durand & Schinz, <i>Ornithogalum thysoides</i> Jacq., <i>Moraea vallisbelli</i> (Goldblatt) Goldblatt, <i>Romulea sabulosi</i> Schltr. ex Beg., <i>Babiana vanzijliae</i> L.Bolus, <i>Ursinia caeruleifolia</i> DC., <i>Garteria personata</i> L., <i>Felicia australis</i> (Aiston) E.Phillips, <i>Cotula horbaria</i> DC.
<i>Biogeographically important taxa: Species are shared with Bokkeveld Sandstone Fynbos, and Shale Renosterveld, indicating the affinities of this ecotonal vegetation type. These include: <i>Moraea vallisbelli</i> (Goldblatt), <i>Babiana vanzijliae</i> L.Bolus, <i>Euryops mirus</i> B.Nord., <i>Euryops virgatus</i> B.Nord., <i>Euryops rosulatus</i> B.Nord., <i>Geissorhiza subrigida</i> L.Bolus, <i>Eriospermum exiguum</i> Goldblatt (regional endemic on shales), <i>Oxalis disticha</i>.</i>					
FRs2.3 Noord Bokkeveld Shale Renosterveld³ Main Type: FRs2 Nieuwoudtville Shale Renosterveld	This subtype is restricted to shallow sandy clays overlying the sandstone cap, and was thus not previously differentiated.	Found only in the Noord Bokkeveld, between Wolwepunt and Kookfontein. The subtype has been heavily transformed by agriculture. Greatly transformed and very few remaining examples of this vegetation type still remain. Not formally conserved.	The habitat is largely flat, and this has resulted in the formation of a number of seasonal pans. The area is most closely related to Vanhyndson Shale Renosterveld but is restricted to the Bokkeveld plateau, has underlying sandstone and a slightly different flora and structure. Fairly homogenous low	Slightly more arid than the area around Nieuwoudtville but very similar; with hot dry summers and mild to cold winters and occasional light snow, and fairly frequent escarpment cloud.	<i>Dicerothamnus rhinocerotis</i> , <i>Wiborgia sericea</i> , <i>Oedera squarroso</i> L., <i>Anderb.</i> & K.Bremer, <i>Senecio juncus</i> (DC.) Harv., <i>Chrysacoma ciliata</i> (Schrad.) N.P.Barker & H.P.Linder, <i>Eriarthria calycina</i> Sm., <i>Cotula turbinata</i> L., <i>Dioscia veronicae</i> Schltr., <i>Dioscia cordisepala</i> Hiern, <i>Chiropolytum graminifolium</i> (Willd.) Kunth, <i>Lachenalia elegans</i> W.F.Barker, <i>Sparaxis elegans</i> (Sweet) Goldblatt (on edges of pan), <i>Oxalis disticha</i> Jacq. (floating aquatic).
<i>Biogeographically important taxa: <i>Cliffortia acutifolia</i>, <i>Sparaxis elegans</i> (Sweet) Goldblatt (regional endemic on shales).</i>					

Table 3 continues on the next page →

TABLE 3 (Continues...): Names, vegetation map codes and summarised descriptions of new vegetation subtypes added to the Vegetation Map of South Africa, Lesotho and Swaziland since the original 2006 publication.

Name of new subtype	Justification for separation	Distribution and protection	Landscape features & vegetation structure	Geology, soils and climate	Species composition
FRs2.4 Papkulsfontein Sandstone Renosterveld³ Main Type: FRs2 Nieuwoudtville Shale Renosterveld	The unit is thus more southern than Nieuwoudtville Sandstone Renosterveld, which is very similar, but supports tall groves of wild olives, which are mostly absent from this vegetation type.	This is an ecotonal subtype and occurs on the Bokeveld plateau at the boundary of Shale Renosterveld and Sandstone Fynbos, in the area from Matjiesfontein south to the Lekenberg area. Not formally conserved and has lost much of its original extent to agriculture. The shallow soils and rocky areas mean that the vegetation is very sensitive to trampling.	to medium tall shrubland, with various grasses and geophytes. Trees absent.	Similar to Renosterveld in the Noord Koperberg, and slightly drier than Nieuwoudtville Sandstone Renosterveld.	Dominant taxa: <i>Searsia lucida</i> , <i>Dicerothamnus rhinocerotis</i> , <i>Wiborgia sericea</i> , <i>Wiborgia monoptera</i> E.Mey., <i>Lycium ferocissimum</i> Miers, <i>Euryops rupestris</i> , <i>Comptonia apiculata</i> L., <i>Chrysocoma ciliata</i> L., <i>Diospyros pubescens</i> , <i>Nylanderia spinosa</i> , <i>Cliffortia juniperina</i> L.f., <i>Berkheya</i> sp., <i>Heterachis aculeata</i> L., <i>Gorteria personata</i> L., <i>Senecio cakilefolius</i> , <i>Erodium moschatum</i> (alien), <i>Rhynchospitidium plumatum</i> (L.f.) De., <i>Lapeirousia divaricata</i> Baker, <i>Hesperantha pauciflora</i> G.J.Lewis, <i>Trachyandra muricata</i> (L.f.) Kunth, <i>Lachenalia elegans</i> W.F.Barker, <i>Ehrhartia calycina</i> Sm., <i>Prosopis</i> is a fairly common invasive tree, along with annual grasses such as <i>Lolium</i> and <i>Avena</i> . Biogeographically important taxa: Special species are shared with Bolkeveld Sandstone Fynbos, and Shale Renosterveld, indicating the affinities of this ecotonal vegetation type. These include: <i>Euryops mirus</i> B.Nord., <i>Euryops rosulatus</i> B.Nord., <i>Hesperantha riuiulica</i> Goldblatt, <i>Conophytum swanepoelianum</i> Rawé ssp. <i>swanepoelianum</i> , <i>Lotononis carnea</i> B.-E. van Wyk, <i>Bobiana pauciflora</i> G.J.Lewis, <i>Eriospermum erinum</i> P.-L.Perry, and <i>Geissoschiza aculeata</i> L.Bolus, <i>Pelargonium fasciculaceum</i> E.M. Marais, <i>Heterachis aculeata</i> (Burm.f.) Roessler.
FS3.2 Varkulei Shale Strandveld⁴ Main Type: FS3 Saldanha Flats Strandveld	Along with the unusual shale substrate, the vegetation consists of elements of Granite Strandveld (<i>Hesperantha erecta</i> , <i>Senecio aloides</i> , <i>Ruschia cf. longebaenensis</i>), Dune Strandveld (<i>Pteronia onobromoides</i> , <i>Zigphyllium norgastra</i> , <i>Chrysanthemoides manana</i>), Flats Strandveld (<i>Willdenowia incurvata</i> , <i>Thamnochortus bachmannii</i>), and Shale Renosterveld (<i>Searsia incisa</i>).	Located close to the town of Laingville, north-east of Vredenburg. Very restricted in extent, and has already been substantially transformed, so that less than 60 ha remain intact. Large parts of this unit have been ploughed up, and most of the remaining slopes are too steep or rocky for cereal agriculture. Unconserved.	The unit occurs on a low-shale hill close to the sea, just east of Laingville, and is the only shale within the Vredenburg region, which was one of the primary reasons for the recognition of this as a distinct unit. Low to medium shrubland, with restios, succulents, low shrubs, and annuals all prominent.	The remaining portion features a fair degree of exposed shales. Soils are clay and clay loams, with heavy soils that support better aerated, lighter soils. The unit is hot, dry and windy in summer but being close to the sea receives a substantial amount of coastal fog, which may account for the presence of species more typical of Strandveld than Renosterveld.	Dominant taxa: <i>Willdenowia incurvata</i> (Thunb.), H.P.Linder, <i>Senecio aloides</i> DC., <i>Galenia fruticosa</i> (L.f.) Sond., <i>Searsia incisa</i> , <i>Passerina filiformis</i> spp. <i>Glutinosa</i> (Thoday) Bredenkamp & A.E. van Wyk, <i>Aspalathus cf. hispida</i> Thunb. (sterile), <i>Ruschia cf. longebaenensis</i> L. Bolus, <i>Euphorbia burmanii</i> (Klotzsch & Garcke) E. Mey. ex Boiss., <i>Searsia glauca</i> , <i>Ruschia ct. cupulata</i> Schwantes, <i>Ehrhartia thunbergii</i> Gibbs Russ., <i>Ficinia indica</i> (Lam.) H.Pfeiff., <i>Thesium strictum</i> P.J. Bergius, <i>Pteronia onobromoides</i> DC., <i>Asparagus capensis</i> L., <i>Chrysanthemoides incana</i> (Burm.f.) Norl., <i>Thamnochortus cf. bachmannii</i> Mast., <i>Onosiphon suffruticosum</i> (L.) Kälersjö, <i>Trachyandra falcatifolia</i> (L.f.) Kunth, <i>Melobium heterophyllum</i> (L.) Druce, <i>Oxalis luteola</i> Jacq., <i>Oxalis hirta</i> L., <i>Ficaria dregei</i> DC., <i>Hesperantha erecta</i> (Baker) Benth. ex Baker.
FFs13.2 Stormsvlei Aalwyn Fynbos² Main Type: FFs13 North Sonderend Sandstone Fynbos [In Helme (2007c) as Stormsvlei Thicket Fynbos]	Differentiated by the vegetation, which is a mix of Renosterveld, Fynbos and Thicket, which may be partly a product of very long fire intervals caused by rocky substrate.	Occurs in a small area, north of the town Stormsvlei. Much of original extent still remains. Unconserved.	The type has an interesting mix of Renosterveld, Fynbos and Thicket dominants, with Thicket dominating in protected gullies.	Occurs in an area that has a bimodal autumn and spring rainfall peak.	Dominant taxa: <i>Aloe ferox</i> , <i>Protea nitida</i> Mill., <i>Prataea repens</i> , <i>Leucadendron salignum</i> R. Br., <i>Sideroxylon inerme</i> L., <i>Buddleja saligna</i> Willd., <i>Olea europaea</i> ssp. <i>cuspidata</i> , <i>Gymnosporia buxifolia</i> , <i>Cifioria ruscifolia</i> L., <i>Aspalathus hirta</i> , <i>Muraria heisteria</i> (L.) DC., <i>Rehmannia pungens</i> L'Hérit., <i>Erica inaequalis</i> (Klotzsch) E.G.H.Oliv., <i>Serruria acrocarpa</i> R.Br. Biogeographically important taxa: <i>Athanasia oocephala</i> (DC.) Källersjö, <i>Opuntia imbricata</i> , <i>Acrodon purpureostylus</i> (L.Bolus) Burgyone.
SKt2.2 Hantam Escarpment Shrubland⁵ Main Type: SKt2 Hantam Karoo [In Van der Mervé et al. (2008b) as <i>Galenia africana</i> - <i>Pteronia glauca</i> Escarpment Karoo]	The abundance of <i>Pteronia glauca</i> is diagnostic of this subtype.	This subtype is located on the slopes of the Hantam Mountain, the undulating slopes of the escarpment in and can also be found in the mosaic between the southwest of Calvinia, and the slopes where the Roggeveld and Klein Roggeveld Mountains meet. The subtype is also found in the mosaic between the Roggeveld and Koedoesberg Mountains. Elements can also be found on ridges between dolerite soils at Grootfontein, east of Nieuwoudtville.	The landscape is a mix of undulating slopes of the escarpment in and can also be found in the mosaic between the Roggeveld and Koedoesberg Mountains. Small patches can be found on dolerite ridges. Scrub cover is high (> 70%), while grass and annual components are not well represented.	Land types include Fb, Ia, Ib and Da, ranging from 700 m to 1200 m above sea level. Ecca shales and dolerite intrusions predominate on gently sloping terrain. A low rock cover (> 80%) consisting of gravel, small stones, stones and boulders, covers the light brown or brown loamy soils.	Dominant taxa: <i>Pteronia glauca</i> Thunb., <i>Eriocaulus purpureus</i> Burch., <i>Pentzia incana</i> (Thunb.) Kunze, <i>Ruschia cradockensis</i> , <i>Eriocaulus ericoides</i> (L.f.) Druse, <i>Asparagus capensis</i> L., <i>Ruschia intricata</i> H.E.K. Hartmann, <i>Ardaria noctiflora</i> L., <i>Drosanthemum</i> sp., <i>Pteronia pallens</i> L.f.

Twelve of the centres of plant endemism have not been refined in the nine-year update period. Of these, seven (i.e. Albany Centre, Drakensberg-alpine Centre, Barberton Centre, Wolkberg Center, Sekhukhuneland Centre, Soutpansberg Centre and Griqualand Centre) occur in the northern and central interiors of the country. These centres coincide with areas that either historically fell within the homeland territory (Wessels et al. 2004), are agricultural areas or are areas of economic development. Thus, botanical exploration has not been conducted to the same extent as in the eastern and western coastal regions where the updates have occurred. These unrefined parts of the northern, central interior and parts of the coastal Western Cape need to be prioritised for future refinement as the units in these regions are often large and were initially mapped at a coarse scale by inferring vegetation types from environmental patterns, e.g. land types were used to map many vegetation types in the Nama Karoo. In addition, many of these areas are in various stages of land-use transformation caused by urban and industrial development (Donaldson 2006), platinum and coal mining (Jeffrey 2005; Armitage, McDonald & Tredoux 2007), the installation of solar and wind farms (Sparks et al. 2014) and shale gas development activities (Greef 2012).

To improve the VEGMAP in these regions, we need to streamline a process of data collection from the mapping of units to the submission and acceptance of updates, while providing reasonable standards to maintain data quality. To this end, we are developing a defined classification hierarchy for the VEGMAP, explicit standards to guide the mapping of VEGMAP units across each of the biomes and a set of guidelines for submitting and accepting updates to the VEGMAP. We are also exploring more proactive approaches to narrowing gaps between the expert driven classification that underpins the current VEGMAP and the actual communities that they represent.

Acknowledgements

The Vegetation Map Project is a large collaborative project that has spanned over two decades. Many have contributed to the success of this project and are too numerous to name individually; however, they are acknowledged in the original publication. The authors wish to thank Mr Nick Helme, Dr Helga van der Merwe, the late Mr Robb Scott-Shaw, Mr Boyd Escott and Mr Jan Vlok for sharing data that contributed to the updated areas in the 2009 and 2012 versions of the vegetation map. The authors also thank Emily Botts for proofreading.

Competing interests

The authors declare that they have no financial or personal relationships that may have inappropriately influenced them in writing this article.

Authors' contributions

A.D. prepared the draft; L.P. implemented the bulk of the technical changes to the map; and T.R. and A.S. edited the text.
